Foreword	iii
Preface	v
1 Introduction to the theory of probability metrics	1
1.1 Probability metrics	2
1.2 Minimal and protominimal metrics	12
1.3 Special minimal and protominimal metrics	21
1.4 Ideal metrics	34
1.5 Relationships between metrics	58
1.6 Linearly invariant metrics	85
2 The nature of limit theorems	93
2.1 The history of limit theorems	93
2.2 A generalization of the Lindeberg–Feller theorem	103
2.3 Natural estimates of convergence rate in the central limit theorem	115
2.4 Limit theorems as stability theorems	126
2.5 One more mechanism forming the central limit theorem	137
3 The normalization of random sequences	145
3.1 General normalization problems	145
3.2 The choice of constants under linear normalization	155
4 Centers and scatters of random variables	163
4.1 The definition and properties of index, centers and scatters	163
4.2 An analog of the Chebyshev inequality	171
4.3 Centers and scatters in the criteria of L -compactness	176
4.4 Centers and scatters in the criteria of L -convergence of random sequences	181
5 Classical theory of limit theorems for sums of independent random variables	195
5.1 Reduced models	195

5.2	Infinitely divisible laws	202
5.3	Limit theorems of the classical theory	207
5.4	The estimates of accuracy of approximations in limit theorems of the classical theory	227
5.5	On completeness of classical theory	249
6	Generalizations of the classical theory of summation of independent random variables	259
6.1	The history of the problem	259
6.2	Stability of compositions of distributions	262
6.3	Limit theorems in a non-classical setting	279
6.4	Limit theorems in the generalized summation scheme	310
6.5	The method of metric distances	340
6.6	Sums of non-independent random variables	380
	Bibliography	397
	Index	411
