<i>Preface</i>	ix
I / Introduction	1
1. Markov Processes	1
Discrete time Markov process 1, Continuous time Markov processes 3, Notation 4, Continuity 4	
2. Strong Markov Processes	4
Markov time 5, Strong Markov process 5, Discrete parameter processes 7, Feller processes 8, Weak infinitesimal operator of a strong Markov process 9, Dynkin's formula 10	
3. Stopped Processes	11
4. Itô Processes	12
Strong Markov property 15, Differential generator 15, Itô's lemma 16, Stopped processes 17, Weakening of condition (4-5) 18	
5. Poisson Differential Equations	18
Second form of the Poisson equation 20	
6. Strong Diffusion Processes	22
7. Martingales	25
II / Stochastic Stability	27
1. Introduction	27
Definitions 30, The idea of a Liapunov function 33, The stochastic Liapunov function approach 34, History 35	
2. Theorems. Continuous Parameter	36
Assumptions 36, Definition 39, Remark on time dependence 41, Remark on strong diffusion processes 44	
3. Examples	55
4. Discrete Parameter Stability	71
5. On the Construction of Stochastic Liapunov Functions	72

III / Finite Time Stability and First Exit Times	77
1. Introduction	77
2. Theorems	79
Strong diffusion processes 89	
3. Examples	91
Improving the bound 100	
IV / Optimal Stochastic Control	102
1. Introduction	102
A dynamic programming algorithm 103, Discussion 106, A deterministic result 107, The stochastic analog 108	
2. Theorems	109
Terminology 109, A particular form for $F(V(x))$ 118, An optimality theorem 118, Control over a fixed time interval 121, Strong diffusion process 124, General nonanticipative comparison controls 126, "Practical optimality": Compactifying the state space 128	
3. Examples	130
4. A Discrete Parameter Theorem	141
V / The Design of Controls	143
1. Introduction	143
2. The Calculation of Controls Which Assure a Given Stability Property	144
3. Design of Controls to Decrease the Cost	147
The Liapunov function approach to design 150
