Preface to the English Edition	vii
Preface	ix
Introduction	xi
Chapter I. Foundations of Probability Theory and Limit Theorems	1
§1. Probability spaces and random variables	1
§2. Probability distributions of random variables (random vectors) and characteristic functions	3
§3. Convergence of sequences of random variables	6
§4. Limit theorems for sums of independent random variables	7
§5. Conditional expectations and martingales	8
§6. Measures on function spaces (measures induced from stochastic processes)	12
Chapter II. Systems of Gaussian Random Variables	15
§1. Definitions and preliminaries	15
§2. Some important properties of a Gaussian system	17
§3. Complex Gaussian systems	21
§4. Discrete parameter Gaussian processes: Canonical representation	25
§5. Continuous parameter Gaussian processes: Brownian motion	31
Chapter III. Stationary Gaussian Processes and Their Representations	37
§1. Discrete parameter stationary processes	37
§2. Spectral representation of a stationary Gaussian process	42
§3. Canonical representation of stationary processes I: The discrete parameter case	46
§4. Canonical representation of stationary processes II: The continuous parameter case	52
Chapter IV. Canonical Representation of Gaussian Processes: General Theory and Multiplicity	55
§1. Propagation of random phenomena	55
§2. Canonical representation and multiplicity	57

§3. Gaussian processes and reproducing kernel Hilbert spaces	66
§4. Examples of a canonical representation and a noncanonical one	70
§5. Application to prediction theory	74
Chapter V. Multiple Markov Gaussian Processes	79
§1. Multiple Markov processes with discrete parameter	80
§2. Multiple Markov Gaussian processes with continuous parameter	83
§3. Multiple Markov Gaussian processes in the restricted sense	89
§4. Multiple Markov stationary Gaussian processes	100
§5. Lévy's $M(t)$ -process	107
§6. T -positivity	116
Chapter VI. Equivalence of Gaussian Processes	121
§1. Setting up the problem	121
§2. General theory of equivalence of Gaussian measures	122
§3. Equivalence of Gaussian processes with discrete parameter	128
§4. Canonical representations of Gaussian processes equivalent to Wiener processes	131
§5. Canonical representation of Gaussian processes equivalent to a given Gaussian process	141
§6. Constructing innovation processes	143
Appendix. Stochastic Integrals and Martingales	149
§1. Multiple Wiener integrals	149
§2. Martingales and stochastic (Itô) integrals	156
§3. Itô's formula and Girsanov's theorem	165
Historical Notes	171
References	177
Subject Index	181
