

CONTENTS

1	UNCERTAINTIES AND FREQUENCY DISTRIBUTIONS	1
	Introduction: calibration. Uncertainty of measurement. Sources of uncertainties. Uncertainties as distributions. Histograms. Frequency distributions. Probability. Asymmetry. Gaussian or normal distribution. Uncertainty of measurement: definition.	
2	THE GAUSSIAN DISTRIBUTION	9
	Simple derivation of the Gaussian distribution. Determination of constants A and λ . Standard deviation of Gaussian distribution. Alternative derivation of Gaussian function. Generalization of proof. Approximation to the mean μ of a distribution. Approximation to the standard deviation σ . Mean absolute deviation η . Combination of two Gaussian distributions. Standard deviation of the mean or standard error. Standard deviation of the standard deviation. Tolerance intervals and tolerance probabilities. Confidence intervals and confidence probabilities with reference to the mean value. Weighted mean. Standard deviation of the weighted mean. Estimation of the standard deviation of the weighted mean from observations made. Standard deviation of the mean by external consistency. Standard deviation of the mean by internal consistency. Examples.	
3	GENERAL DISTRIBUTIONS	52
	A double integral theorem. Expressions for the double integral theorem. Alternative forms of theorem. Integral functions. General case: combination of uncertainty populations or frequency distributions. Standard deviation of combined or convoluted distribution. Rule for compounding uncertainty distributions. Standard deviation of $\sum_1^n x_r$. Standard deviation of arithmetic mean or standard error. Combination of a stochastic distribution with a Gaussian distribution. Standard deviation of the combination of a stochastic distribution with a Gaussian distribution. Relation between ϵ_r and a_r . Alternative formula for standard deviation of the combination of a stochastic distribution and a Gaussian distribution. Example. Skewness. Coefficient of Kurtosis or peakedness of a distribution. Examples.	
4	RECTANGULAR DISTRIBUTIONS	111
	Rectangular distribution. Compounding or convoluting two rectangular distributions. Probability distribution formed by combining two rectangular distributions whose ranges are $\pm h$ and $\pm k$, $k \geq h$. Standard deviation of combination. Combination of two rectangular distributions with semi-ranges of $\pm a$ and $\pm 2a$. Combination of two rectangular distributions each with a semi-range of $\pm a$. Compounding of three rectangular distributions: general case $j < h + k$. Combination of three rectangular distributions of equal semi-range $\pm a$. Combination of three rectangular distributions with semi-ranges $\pm a$, $\pm 2a$ and $\pm 3a$. Compounding of three rectangular distributions: general case $j \geq h + k$. Combinations of three rectangular distributions with semi-ranges of $\pm a$, $\pm 1.5a$ and $\pm 3a$. Compounding of four rectangular distributions each with a semi-range of $\pm a$. Combination of a Gaussian and a rectangular distribution. Approximate rectangular density function. Combination of rectangular and Gaussian distribution. Numerical computation. Combination of a rectangular distribution	

with a Gaussian distribution: probability of an uncertainty in the range -2σ to 2σ . Calculation of approximate probabilities for the combination of rectangular distributions with themselves and with a Gaussian distribution. Examples.

5 DISTRIBUTIONS ANCILLARY TO THE GAUSSIAN 186

The Student or t distribution. Probability of the mean μ lying within a given range. The chi-squared (χ^2) distribution. Parameters of the χ^2 distribution. Use of χ^2 distribution to find a maximum and a minimum value of σ , for a given probability, where the given probability is that of the maximum value of σ being exceeded and is also the probability of σ being less than the minimum value of σ . F distribution. Parameters of the F distribution. Tolerance limits, factors and probabilities, and confidence limits, factors and probabilities. The uncertainty of a single reading, and the probability of it occurring over a given range: without confidence probabilities (known parameters μ and σ). Uncertainty of a single reading: without confidence probabilities (known parameters \bar{x} and σ). Uncertainty of a single reading: without confidence probabilities (known parameters \bar{x} and s). Uncertainty of a single reading: without confidence probabilities (known parameters μ and s). The uncertainty of a single reading: with confidence probabilities (known parameters \bar{x} and σ). Uncertainty of a single reading: with confidence probabilities (known parameters \bar{x} and s). Uncertainty of a single reading: with confidence probabilities (known parameters μ and s). Probability of an uncertainty in the mean: confidence probability and confidence limits. Probability of an error in σ . Index to uncertainties (Gaussian). Derivation of standard deviation σ from extreme range. Derivation of standard error $\sigma_{\bar{x}}$ (standard deviation of mean) from extreme range. Examples.

6 THE ESTIMATION OF CALIBRATION UNCERTAINTIES 212

Standard deviation of a function of n variables. Standard deviation of the mean of a function of n variables. Generalized standard deviation in the mean. Estimation of component uncertainties. Measurable uncertainties. Guidance on which tables to use. Selection of tolerance probability. Estimated uncertainties. Rectangular uncertainties. Maximum value only uncertainties. Gaussian estimated. Combination of uncertainties to give total uncertainty. Summary of terms. Examples.

7 CONSISTENCY AND SIGNIFICANCE TESTS 231

t test: comparison of two means when both sets of observations belong to the same population, and so $\sigma_1 = \sigma_2$, that is, both sets have equal variances. Combined mean and standard deviation. t test: comparison of two means which do not come from the same population, and so $\sigma_1 \neq \sigma_2$, that is, their variances are not equal. F test: comparison of two standard deviations when both samples come from the same population. Relationship of F distribution to other distributions. F test: internal and external consistency tests. Weights. Results consistent. χ^2 test to check if a hypothetical distribution $F(x)$ fits an empirically obtained distribution. Kolmogorov-Smirnov statistic. Examples.

8 METHOD OF LEAST SQUARES 254

Determination of a mean plane. Readings along diagonals. Parallel sides. Calculation of mean plane. Change of axes. Standard deviation from mean plane. Curve fitting: fitting a straight line. Weighted mean line. Standard error in the mean of y_i from the mean line $\tau = m\epsilon$. Standard deviation in the mean σ_m of the gradient m . Alternative derivation for standard deviation in the mean

of the gradient m . Standard deviation in mean of c . Alternative derivation of standard deviation of mean in c . Standard deviation in mean of x_0 . A simple treatment of the straight line $y = mx + c$. Correlation (linear). Significance of r . Determination of the constants p , q and s in a normal frequency distribution with two variables. Derivation of line of regression from 8.66(1). Note on value of r . Non-linear correlation and best fit for a parabola. Alternative derivation of best fit for a parabola. Least squares fit for general function. Criterion for choice of best curve or functional relation. Examples.

9

THEOREMS OF BERNOULLI AND STIRLING AND THE BINOMINAL, POISSON AND HYPERGEOMETRIC DISTRIBUTIONS

311

Bernoulli's theorem. Average and most probable value of r for Bernoulli's expansion. Standard deviation of Bernoulli distribution. Bernoulli's limit theorem. Stirling's theorem. Bernoulli's theorem: approximation using Stirling's theorem. Alternative derivation of an approximation to binomial probabilities for moderate values of p , the probability of a single event (i.e. $p \simeq \frac{1}{2}$). Poisson distribution. Note on Poisson's law of distribution. Average value of r . Standard deviation of Poisson's distribution. The hypergeometric function. Standard deviation and mean value of the hypergeometric distribution. Approximation to the hypergeometric probability function. Approximation to the sum of the hypergeometric probabilities. Examples.

APPENDIX I

341

Tables. Choice of tables.

Table I: Values of the density function of the normal distribution $f(c) = e^{-c^2/2}/\sqrt{(2\pi)}$.

Table II: Values of $\frac{1}{\sqrt{(2\pi)}} \int_{-k_1}^{k_1} e^{-c^2/2} dc = P$
 $-k_1$ to k_1

Table III: Values of k_1 corresponding to $P = \frac{1}{\sqrt{(2\pi)}} \int_{-k_1}^k e^{-c^2/2} dc$
 $-k_1$ to k_1

Table IV: Values of the Student distribution $\beta_{tp} = \int_{-t_p}^{t_p} f(t_v) dt_v$.

Table V: Confidence limits for the mean μ for two confidence probabilities 0.95 and 0.99 for integral values of n , the number of observations.

Table VI: Probability values for χ^2 distribution.

Table VII: Confidence intervals for σ , the standard deviation.

Table VIII: Upper limits for F test for a probability of 0.05.

Table IX: Upper limits for F test for a probability of 0.01.

Table X: Tolerance limits for a single observation for two tolerance probabilities 0.95 and 0.99, given \bar{x} and σ .

Table XI: Tolerance limits for a single observation for two tolerance probabilities 0.95 and 0.99, given \bar{x} and s .

Table XII: Tolerance limits for a single observation for three tolerance probabilities 0.90, 0.95 and 0.99 and two confidence probabilities 0.95 and 0.99, given \bar{x} and σ .

Table XIII: Tolerance limits for a single observation for four tolerance probabilities 0.90, 0.95, 0.99 and 0.999 and three confidence probabilities 0.90, 0.95 and 0.99, given \bar{x} and s .

Table XIV: Tolerance limits for a single observation for three tolerance probabilities 0.90, 0.95 and 0.99 and two confidence probabilities 0.95 and 0.99, given μ and s .

Table XV: The probability of a given value of t^2 being exceeded for seven probabilities and various values of ν .

Table XVI: The standard deviation σ as a fraction of the mean extreme range for various values of n , the number of observations per set.

Table XVII: The standard error $\sigma_{\bar{x}}$ as a fraction of the mean extreme range for various values of n .

Table XVIII: Values of the bias corrector for s obtained from s^2 .

Table XIX: Poisson distribution function or accumulated Poisson probabilities.

Table XX: Acceptance limits for the Kolmogorov-Smirnov test of goodness of fit.

Table XXI: Acceptance limits for the Kolmogorov-Smirnov test of the identity of two distributions, that is, that $F_1(x) \equiv F_2(x)$ where $F(x)$ is a distribution function.

APPENDIX II

375

Proof that $F_0(p; \nu_1; \nu_2) = \frac{1}{F_0(1-p; \nu_2; \nu_1)}$

APPENDIX III

377

Proof that:

$$\underbrace{\sum_{q=1}^{q=m} \sum_{r=1}^{r=n_q} \frac{w_{rq}(x_{rq} - \mu)^2}{\sigma^2}}_{\chi_0^2} =$$

$$\underbrace{\sum_{q=1}^{q=m} \sum_{r=1}^{r=n_q} \frac{w_{rq}(x_{rq} - \bar{x}_q)^2}{\sigma^2}}_{\chi_1^2} + \underbrace{\sum_{q=1}^{q=m} \sum_{r=1}^{r=n_q} \frac{w_{rq}(x_{rq} - \bar{x})^2}{\sigma^2}}_{\chi_2^2} + \underbrace{\sum_{q=1}^{q=m} \sum_{r=1}^{r=n_q} \frac{w_{rq}(x_{rq} - \mu)^2}{\sigma^2}}_{\chi_3^2}$$

APPENDIX IV

379

The uncertainty in the difference in height between points on a surface.

APPENDIX V

398

Confidence and tolerance limits of g for given x , that is for $x|y$ for a mean line.

APPENDIX VI

400

Computational formulae.
