1. Random marked point processes and processes with an embedded marked point process	13
1.0. Introduction	13
1.1. Random marked point processes	14
1.1.1. Simple point processes	16
1.1.2. Markov renewal processes	18
1.1.3. Independent marking, superposition	18
1.1.4. Campbell's theorem	19
1.1.5. Weak convergence	20
1.2. Stationary RMPP's. The Palm distribution	21
1.2.1. The Palm distribution	23
1.2.2. The refined Campbell theorem	25
1.2.3. Inversion formula, Korolyuk's and Dobrushin's theorem	26
1.3. Characterizations of the Palm distribution	29
1.3.1. Synchronous RMPP's	30
1.3.2. Local characterization of the Palm distribution	33
1.3.3. A generalized Erlang phase method	34
1.3.4. Mixtures of RMPP's	34
1.3.5. Superpositions of RMPP's	35
1.3.6. Ergodic theorems	36
1.3.7. RMPP's with multiple points	38
1.4. The distribution P_L^0	39
1.5. Processes with embedded marked point process	44
1.6. Intensity conservation principle	47
1.7. Remarks and references	53
2. Time- and customer-stationary processes for queueing systems. Existence and ergodic theorems	58
2.0. Introduction	58
2.1. Notations	60
2.2. General approach to existence, uniqueness and ergodic theorems	62
2.3. Systems without delay	63
2.3.1. The system $G/G/\infty$	63

2.3.2.	The loss system $G/G/s/0$	70
2.3.3.	Stationary distributions of system quantities	76
2.4.	Systems with delay	77
2.4.1.	Single-server queues	77
2.4.2.	Multi-server queues	82
2.4.3.	Stationary distributions of system quantities	84
2.5.	Remarks and references	86
3.	Continuity theorems for time- and customer-stationary quantities	88
3.0.	Introduction	88
3.1.	Systems without delay	89
3.2.	Systems with delay	95
3.3.	Remarks and references	101
4.	Relationships between time- and customer-stationary quantities.	
	I: Basic systems	104
4.0.	Introduction	104
4.1.	Systems with a Poisson process of arrival instants	105
4.2.	Little's formulae	106
4.3.	The number of customers	111
4.3.1.	Some elementary results	112
4.3.2.	Equation systems	115
4.4.	Some formulae concerning busy cycles	124
4.5.	Extensions of Takács' formulae for $G/G/1/\infty$	126
4.6.	The work load in $G/G/s/r$	130
4.7.	Repairman problem	138
4.8.	Remarks and references	139
5.	Relationships between time- and customer-stationary quantities.	
	II: Further systems	143
5.0.	Introduction	143
5.1.	Several customer types	143
5.1.1.	Little's formulae	143
5.1.2.	Takács' formulae for $G_N/GI_N/1/\infty$	145
5.1.3.	Semi-Markovian input	146
5.2.	Group arrivals	150
5.3.	Varying service rate	152
5.4.	Uniformly bounded work load; warming up	155
5.5.	Remarks and references	157

6. Insensitivity of stationary state probabilities for a class of queueing systems	160
6.0. Introduction	160
6.1. General queueing systems	161
6.2. Construction of a suitable queueing process	163
6.2.1. State space	163
6.2.2. Initial state	164
6.2.3. Temporal behaviour	164
6.3. The equation system Z and the property $E((I_j)_{j \in J})$	166
6.4. The main result	167
6.5. Embedded probabilities and mean sojourn times of insensitive systems	171
6.6. Poisson output of an insensitive queueing system	172
6.7. Examples	174
6.7.1. The Erlang loss system $M/G/s/0$ with speeds	174
6.7.2. The Engset loss and the Engset delay system (repairman problem)	176
6.7.3. A simple closed queueing network	181
6.8. The structure of insensitive queueing systems	183
6.8.1. The general model	184
6.8.2. Insensitivity conditions	185
6.8.3. Main result	186
6.9. Remarks and references	186
Bibliography	190
Result Index	200
Symbol Index	202
