<b>1</b>	<b>Predicting the Outcome of the World Series</b> by <b>Richard G. Brown</b> . . . . .	<b>1</b>
	By direct mathematical attack and by computer simulation, we calculate the probabilities of the overall outcome of a sequence of independent events.	
<b>2</b>	<b>Normal Probability Distributions</b> by <b>Roger Carlson</b> . . . . .	<b>13</b>
	The normal probability distribution is discussed and its use as an approximation to discrete distributions explained. Tables and graphs of the normal distribution are used in several examples.	
<b>3</b>	<b>How Much Does a 40-Pound Box of Bananas Weigh?</b> by <b>Ralph B. D'Agostino</b> . . . . .	<b>29</b>
	Bananas differ in weight and so boxes cannot be packed to exact weight; furthermore, they shrink during shipping. How much variation in packing weight can be tolerated?	
<b>4</b>	<b>Grocery Shopping and the Central Limit Theorem</b> by <b>Samuel Zahl</b> . . . . .	<b>33</b>
	The central limit theorem is applied to a housewife's method of quickly approximating the cost of a basket of groceries to show that if she buys several items her results will probably be satisfactory.	
<b>5</b>	<b>Chi-Square Distributions by Computer Simulation</b> by <b>R. K. Tsutakawa</b> . . . . .	<b>39</b>
	The chi-square test is applied to two examples, one involving the recovery of banded geese and the other the effect of cloud seeding on rainfall. Simulations of sampling by use of random numbers helps in studying the properties of the chi-square statistic and hence its applicability to prob- lems of this type.	

<b>6</b>	<b>Sensitive Fingers and Defective TV Tubes</b> <b>by Ivor Francis and William H. Kruskal</b> . . . . .	63
	In testing extrasensory perception, production of TV tubes, or social theories, a special probability distribution, the hypergeometric, may aid us.	
<b>7</b>	<b>Studying an Expert</b> <b>by Ralph B. D'Agostino</b> . . . . .	75
	The ideas of conditional probability lead to an analysis of errors in a long series of forecasts of crop yields.	
<b>8</b>	<b>The Case of the Vanishing Women Jurors</b> <b>by Stephen E. Fienberg</b> . . . . .	87
	Although over 50% of possible jurors are women, Dr. Spock at his famous trial faced an all-male jury. The author studies the probability of this, using the binomial and hypergeometric distributions in studying the initial jury roll and conditional probabilities in the final selection process.	
<b>9</b>	<b>Transformations for Linearity</b> <b>by Frederick Mosteller</b> . . . . .	99
	Complicated functional relationships between two variables may be easily determined by graphical methods if transformation of one of the variables leads to a straight-line graph. The method is applied both to earth vibrations in the neighborhood of waterfalls and to a problem in the distribution of prime numbers.	
<b>10</b>	<b>The Acceleration of Gravity</b> <b>by John Mandel</b> . . . . .	109
	To bring order into the data of many experiments, the author fits straight lines to a large set of data and thus gets estimates of the acceleration of gravity.	
<b>11</b>	<b>Breaking Deadlocks in Hockey: Prediction and Correlation</b> <b>by Carl Morris</b> . . . . .	119
	To solve a problem in sports, the author fits a straight line to a set of data where one variable predicts another, and he thus develops a method widely used in science for finding a good-fitting line, the method of least squares.	
<b>12</b>	<b>Calibration of an Automobile Speedometer</b> <b>by Charles E. Land</b> . . . . .	141
	In solving the practical problem of calibrating an automobile speedometer, the author illustrates and derives the method of least squares.
