## PART 1

1. Introduction	31
1.1 Characteristic features of nonlinear systems	31
1.1.1 Importance of nonlinear systems	31
1.1.2 Fundamental equations	31
1.1.3 State and phase equations	33
1.1.4 Some special features of nonlinear systems	36
1.1.5 Classification of nonlinearities	38
1.1.6 Analysis of nonlinear systems	40
References	40

## PART 2

2. Methods of linearization	45
2.1 Linearization about an operating point; tangential approximation	46
2.1.1 Determination of the linearized coefficients by expansion	46
2.1.2 An alternate method of linearization	52
2.1.3 The most usual ways of algebraic linearization	54
2.1.4 Linearization of characteristic curves	54
2.1.5 Determination of linearized coefficients by least-square approximation	57
2.1.6 The first test method of Lyapunov	61
2.1.7 Summary	66
References	67
2.2 Harmonic linearization	68
2.2.1 Fundamental assumptions of the describing function method	68
2.2.2 Fundamental relations	69
2.2.3 Generalized describing functions	77
2.2.4 Describing functions of some simple nonlinearities	78
2.2.5 Approximate determination of the describing function	86
2.2.6 An alternate approximate method for the determination of describing functions	90
2.2.7 Stability test	93
2.2.8 Examples for the uses of describing functions	103
2.2.9 The root locus of a nonlinear system	110
2.2.10 Drawbacks of the describing-function method	114
2.2.11 Compensation in nonlinear systems	119
2.2.12 The harmonic-balance method	120

2.2.13	Harmonic linearization of state equations	121
2.2.14	Comparison of the three methods	123
2.2.15	Other describing functions	125
2.2.16	The inverse problem	128
	References	132
2.3	Statistical linearization	136
2.3.1	Fundamental relations	136
2.3.2	Statistical linearization of nonlinear characteristics	140
2.3.3	Expressions of linearized gains	142
2.3.4	Examples of statistical linearization	147
2.3.5	A variant of linearized-gain calculation	156
2.3.6	Statistical linearization of some typical nonlinearities	157
2.3.7	Statistical systems analysis	162
	References	169
2.4	Combined describing functions	171
2.4.1	Dual-input describing functions	171
2.4.2	Incremental locus	174
2.4.3	Approximate dual-input describing function	178
2.4.4	Combined harmonic and random linearization	183
2.4.5	A review of combined linearization formulae	185
2.4.6	Approximate combined linearization	187
	References	189

## PART 3

3.	Transient processes	193
3.1	Graphical methods	194
3.1.1	First-order linear system	194
3.1.2	Linear integrator	197
3.1.3	Single energy-storage nonlinear system	198
3.1.4	Feedback control systems	199
3.1.5	Supplementary comments	201
3.1.6	The secant method	202
3.1.7	Supplementary comments to the secant method	205
3.1.8	The tangent method	209
	References	211
3.2	Numerical methods	212
3.2.1	Taylor series expansion	212
3.2.2	The Euler method	215
3.2.3	The modified Euler method	216
3.2.4	The Adams method	217
3.2.5	The Milne method	219
3.2.6	The Runge-Kutta method	220
3.2.7	Predictor-corrector methods	222
3.2.8	Checking the numerical methods	226
3.2.9	Least-square fitting	227
3.2.10	The use of z-forms in the evaluation of transient processes	229
3.2.11	Naumov's grapho-analytical method	232
	References	235

3.3 Analytical methods	237
3.3.1 Variation of parameters	238
3.3.2 Expansion according to a small parameter	241
3.3.3 A special case of expansion according to a small parameter	244
3.3.4 Finding of periodic solutions by the perturbation method	246
3.3.5 The method of reversion	249
3.3.6 The method of Lighthill and Temple	250
3.3.7 The method of collocation	253
3.3.8 The Galerkin method	256
3.3.9 The Ritz-Galerkin method	258
3.3.10 The Lie series method	261
3.3.11 The asymptotic series method	263
3.3.12 The Taylor-Cauchy transformation	263
3.3.13 The method of recurrence relations	265
3.3.14 The method of complex convolution	268
3.3.15 The method of successive integrations	270
3.3.16 Method of Lalesco's nonlinear integral equations	271
References	275
3.4 Closed-form solutions for transient processes	276
3.4.1 Directly integrable differential equations	277
3.4.2 Linear differential equations of the first order	278
3.4.3 Separable differential equations	279
3.4.4 Introduction of a homogeneous variable	279
3.4.5 Solution of equations derived from a total differential	280
3.4.6 Introduction of an integrating factor	281
3.4.7 Introduction of a new variable	281
3.4.8 Incomplete second-order differential equations	282
3.4.9 The Bernoulli equation	283
3.4.10 The Riccati equation	283
3.4.11 The Euler-Cauchy equation	284
3.4.12 Solution of variable-coefficient linear differential equations	284
3.4.13 Elliptic functions	285
3.4.14 Hyperelliptic functions	289
References	290

## PART 4

4. The state-plane and phase-plane method	293
4.1 The state-plane and phase-plane method	294
4.1.1 Writing up the phase equations	296
4.1.2 Determination of the phase portrait by computation	301
4.1.3 Graphical methods for constructing phase trajectories	312
4.1.4 The evolute methods	322
4.1.5 Time calibration of phase trajectories	326
4.1.6 The Poincaré analysis of singular points	333
4.1.7 Some comments on the Poincaré method	348
4.1.8 Energy relationships and the phase portrait	351
4.1.9 Phase trajectory construction by energy considerations	353

4.1.10	Limit-cycle examination	356
	References	362
4.2	Piecewise linear systems	364
4.2.1	Saturation or limitation	364
4.2.2	Dead band or threshold	367
4.2.3	Variable gain	368
4.2.4	Backlash or hysteresis	371
4.2.5	Adhesion and Coulomb friction	374
4.2.6	Variable damping	377
4.2.7	Examination of piecewise linear systems	380
	References	380
4.3	On-off control systems	382
4.3.1	The block diagram of on-off control	384
4.3.2	Analytical determination of phase trajectories	385
4.3.3	Examples of on-off control	389
4.3.4	The method of characteristic curves	398
4.3.5	The method of point transformation	400
4.3.6	Limit cycle calculation in relay systems	409
4.3.7	Optimal relay control system	416
4.3.8	Minimum-time systems	425
	References	433

## PART 5

5.	Stability of nonlinear systems	439
5.1	Lyapunov's second or direct method	441
5.1.1	The fundamental ideas of stability	442
5.1.2	The notion of sign-definiteness	445
5.1.3	Lyapunov functions	448
5.1.4	The Lyapunov theorems	450
5.1.5	Examples for the application of the Lyapunov method to autonomous systems	456
5.1.6	Proof of the Lyapunov method	466
5.1.7	Application of the Lyapunov method to nonautonomous systems	470
5.1.8	Practical stability	472
5.1.9	Eventual stability	473
	References	475
5.2	Determination of the Lyapunov functions	477
5.2.1	Determination of Lyapunov functions for autonomous linear systems	477
5.2.2	Determination of Lyapunov functions for autonomous nonlinear systems	480
5.2.3	The Krasovskii method	483
5.2.4	The Aizerman method	489
5.2.5	The variable-gradient method for generating Lyapunov functions	491
5.2.6	The Zubov method	494
5.2.7	Determination of Lyapunov functions for nonautonomous systems	498
	References	500
5.3	Canonical forms and transformations	501
5.3.1	The basic equations of direct control	504

5.3.2	The fundamental equations of indirect control	512
5.3.3	Closed formulae of canonical transformation for direct control	518
5.3.4	Closed formulae of canonical transformation for indirect control	523
5.3.5	Methods for constructing the Lyapunov function. Introduction	528
5.3.6	Construction of the Lyapunov function for indirect control	529
5.3.7	Construction of the Lyapunov function for direct control	537
5.3.8	Lur'e's polynomial transformation	539
5.3.9	Special cases of Lur'e's polynomial transformation	547
5.3.10	Simplified stability criteria	550
5.3.11	Pole shifting and zero shifting	551
	References	560
5.4	Synthesis by the Lyapunov method	561
5.4.1	Synthesis on the basis of an integral criterion	561
5.4.2	Synthesis of linear excited systems on the basis of the integral criterion	563
5.4.3	Synthesis of closed-loop control systems	565
5.4.4	Synthesis of an excited nonlinear system	566
5.4.5	The parameter-identification method	569
5.4.6	Synthesis of nonlinear adaptive control systems	571
5.4.7	Synthesis of asymptotically stable optimal nonlinear systems	573
5.4.8	Estimation of the damping rate of a transient process	579
	References	586
5.5	Sampled-data systems	587
5.5.1	Stability definitions	587
5.5.2	Stability theorems	588
5.5.3	The relation between the Routh-Hurwitz criterion and the Lyapunov method	593
5.5.4	The Krasovskii method for discrete-data systems	595
5.5.5	Synthesis of discrete-data systems	599
5.5.6	Estimating the transient process	600
	References	601
5.6	Absolute stability	602
5.6.1	Definition of absolute stability	603
5.6.2	The Popov criterion and its proof	615
5.6.3	Geometric interpretation of Popov's criterion	609
5.6.4	Extension of the Popov criterion	614
5.6.5	Application examples of Popov's criterion	617
5.6.6	Absolute stability of the control process in nonlinear systems	621
5.6.7	The stability degree of nonlinear systems	624
5.6.8	The integral criterion for nonlinear systems	626
5.6.9	Relationship between the Popov and Lyapunov methods	628
	References	629
5.7	Absolute stability of nonlinear discrete-data systems	631
5.7.1	Absolute stability in discrete-data systems	631
5.7.2	Interpretation of the Popov criterion	635
5.7.3	Generalization of the stability criterion	636
5.7.4	The necessary and sufficient conditions of absolute stability	637
5.7.5	Estimation of the degree of stability	637

5.7.6	Quadratic estimation	638
5.7.7	Relationship between the Popov criterion and the Lyapunov method in discrete-data control systems	639
	References	641
5.8	Generalization of the frequency method	642
5.8.1	Absolute stability of systems including a nonlinearity of limited slope	642
5.8.2	Modified stability criteria in the frequency domain	646
5.8.3	Absolute stability of multivariable systems	650
5.8.4	Generalization for time-variable nonlinearities	654
	References	655
PART 6		
6.	Optimal systems	663
6.1	Application of the calculus of variations to the solution of optimal control problems	665
6.1.1	The principal theorems of the classical calculus of variations	665
6.1.2	Variants of the optimal control problems	682
6.1.3	Optimal control of time-invariant systems	693
6.1.4	Linear optimization problems	696
	References	707
6.2	Pontryagin's principle	709
6.2.1	Pontryagin's maximum principle	709
6.2.2	Some examples involving the maximum principle	727
6.2.3	The Pontryagin minimum principle	735
6.2.4	Optimal control of linear time-invariant controlled plants	745
6.2.5	Some features of optimal systems	751
6.2.6	Synthesis of minimum-time systems	763
6.2.7	Design of fuel-optimal systems	820
6.2.8	Design of energy-optimal control	830
6.2.9	Optimal control with a hypersphere-type constraint	837
6.2.10	Optimal control of systems with transportation lags	846
	References	855
6.3	Dynamic programming	867
6.3.1	Fundamentals	867
6.3.2	Connection between dynamic programming and the minimum (maximum) principle	878
6.3.3	Connection between dynamic programming and the calculus of varia- tions	881
6.3.4	Connection between the Lyapunov functions and dynamic program- ming	884
	References	888
6.4	Functional analysis in the solution of optimal control problems	891
6.4.1	Optimal control of single-variable plants	891
6.4.2	Optimal control of multivariable controlled plants	895
6.4.3	Optimal control of time-variable multivariable controlled plants	899
6.4.4	Complementary comments	900
6.4.5	Some numerical examples	901
	References	904

## PART 7

7. Adaptive control systems	909
7.1 Variants of adaptive control systems	910
7.1.1 Passive adaptation	912
7.1.2 Input-variable adaptation	912
7.1.3 Extremal or optimizing systems	914
7.1.4 System-variable adaptation	914
7.1.5 System-characteristic adaptation	915
7.1.6 Supplementary comments	916
References	917
7.2 Some examples of adaptive systems	918
7.2.1 High-gain adaptive systems	918
7.2.2 Adaptive systems with a prescribed damping factor	919
7.2.3 Adaptive missile acceleration control	922
7.2.4 Input signal self-adaptation of a tracking servo	924
7.2.5 Model-reference adaptive systems	926
References	929
7.3 Optimizing methods	930
7.3.1 Fundamental concepts of optimizing systems	931
7.3.2 Some types of optimizing systems	932
7.3.3 Analysis of quasi-stationary processes	945
7.3.4 Methods of searching in complicated optimizing systems	950
References	954
7.4 The theoretical bases of adaptation, learning, and optimizing	956
7.4.1 The criteria of optimality	956
7.4.2 The adaptation process and its algorithm	957
7.4.3 Adaptation under constraints	958
7.4.4 Pattern recognition	959
7.4.5 Identification	962
7.4.6 Adaptive filters	963
7.4.7 Adaptive (dual) control	964
References	966

## PART 8

8. Appendix	971
8.1 Some fundamental principles of matrix calculus and vector analysis	972
8.1.1 Some fundamental theorems of matrix algebra	972
8.1.2 Bilinear and quadratic forms	975
8.1.3 Norms	976
8.1.4 Fundamentals of vector analysis	981
8.1.5 Some rules of differentiation	985
References	988
8.2 State variables, state equations	989
8.2.1 Deduction of the transfer matrix of a controlled plant from the state equations	990
8.2.2 Deduction of the state equations from the transfer function or transfer matrix	991
8.2.3 State equations of feedback systems	996

8.2.4	Normal plants	997
8.2.5	Canonical form	998
8.2.6	Determination of the phase-variable form	1002
	References	1004
8.3	Solution of the state differential equations	1007
8.3.1	Solution of a time-invariant linear homogeneous vector differential equation	1007
8.3.2	Determination of the fundamental matrix	1009
8.3.3	Determination of the fundamental matrix in cases with multiple eigenvalues	1014
8.3.4	Solution of the time-invariant inhomogeneous state equations	1015
	References	1016
8.4	Variable-coefficient differential equations	1017
8.4.1	Solution of time-variable homogeneous state equations	1017
8.4.2	Solution of the time-variable inhomogeneous differential equation	1019
8.4.3	The adjoint system	1021
8.4.4	Determination of the transition matrix	1022
	References	1026
8.5	Reachable states, controllability, observability	1027
8.5.1	Reachable states	1027
8.5.2	Definition of controllability and observability	1027
8.5.3	Controllability of linear time-invariant systems	1028
8.5.4	Observability of linear time-invariant systems	1031
8.5.5	Normal plants	1033
	References	1034
8.6	State and phase equations of sampled-data systems	1035
8.6.1	Determination of homogeneous phase equations	1035
8.6.2	Determination of the phase-variable form from the pulsed-data transfer function	1038
8.6.3	General state equations of sampled-data systems	1040
8.6.4	Solution of linear state equations	1043
8.6.5	$z$ -transformation	1045
8.6.6	Determination of the transition matrix	1047
8.6.7	Determination of the transition matrix of a time-variable plant	1048
8.6.8	Controllability and observability	1050
	References	1052
8.7	Some connections with theoretical mechanics	1053
8.7.1	Fundamental concepts and connections	1053
8.7.2	The Lagrange equation	1056
	References	1061
	List of references	1063
	Index	1087
