1	Organizing and Reading Population Data by Douglas H. Spicer	1
	Organizing data in charts and tables clarifies information about the growth of our population.	
2	Fractions on Closing Stock Market Prices by Frederick Mosteller	9
	Exploring data can lead us to a theory, but we may need still more data to prove or disprove it.	
3	Characteristics of Families and Their Members: How to Get Information from a Table by Joseph I. Naus.	15
	To summarize our data, we may use averages, and we may also need to get relations between variables.	
4	Points and Fouls in Basketball by Albert P. Shulte	27
	If two variables rise and fall together, does a change in one cause a change in the other?	
5	Examples of Graphical Methods by Yvonne M. M. Bishop	33
	Special graphs called histograms display frequencies and others called scatter diagrams show relations between variables in data about diabetes, cancer, and heart disease.	
6	Babies and Averages by William H. Kruskal	49
	The concept of averages can be both used and abused, as this example shows.	
7	Collegiate Football Scores by Frederick Mosteller	61
	Simple questions about scores lead us to organize data into frequency distributions which stimulate new questions. Answering them gives us systematic methods of analyzing data.	

8	Ratings of Typewriters by Frederick Mosteller	75
	Sometimes we can get information from data more easily by merely rearranging them in a systematic way.	
9	The Cost of Eating by William H. Kruskal	79
	We can organize lists of prices to find the most economical way to buy goods.	
10	Turning the Tables by Joel E. Cohen	87
	Counting possibilities gives us a way to decide whether an event is as unusual as it seems to be.	
11	Testing Beer Tasters by William H. Kruskal	91
	Counting possibilities and multiplying probabilities tells us about the design of an experiment.	
12	Estimating the Size of Wildlife Populations by Samprit Chatterjee	99
	Through the “capture-recapture” method, we can estimate the size of a population that cannot be counted directly.	
13	Tom Paine and Social Security by William H. Kruskal and Richard S. Pieters	105
	Two centuries ago Tom Paine made errors, similar to those we make today, that resulted in underestimating the costs of a proposed welfare program.	
14	Fruit Flies by Richard F. Link	113
	An experiment on the inheritance of size of eye in the fruit fly introduces us to the equilikely binomial distribution. We simulate the experiment by coin tossing.
