

CONTENTS

Preface	ix
Acknowledgements	xi
List of notation	xii
1 Introduction	1
1.1 Simulation	1
1.2 What do we mean by a model?	2
1.3 Examples of models which may be investigated by simulation	2
1.4 The tools required	4
1.5 Two further uses of simulation	5
1.6 Computers, mathematics and efficiency	7
1.7 Discussion and further reading	8
1.8 Exercises and complements	8
2 Some probability and statistics revision	12
2.1 Random variables	12
2.2 The cumulative distribution function (c.d.f.)	13
2.3 The probability density function (p.d.f.)	13
2.4 Joint, marginal and conditional distributions	14
2.5 Expectation	15
2.6 The geometric, binomial and negative-binomial distributions	16
2.7 The Poisson distribution	18
2.8 The uniform distribution	20
2.9 The normal distribution and a central limit theorem	23
2.10 Exponential, gamma, chi-square and Laplace distributions	24
2.11 Distributions of other continuous random variables	28
2.12 New random variables for old	29
2.13 Convolutions	37
2.14 The chi-square goodness-of-fit test	38
*2.15 Multivariate distributions	39
*2.16 Generating functions	41

2.17	Discussion and further reading	45
2.18	Exercises and complements	46
3	Generating uniform random variables	51
3.1	Uses of uniform random numbers	51
3.2	Continuous and discrete uniform random variables	52
3.3	Dice and machines	52
3.4	Pseudo-random numbers	56
3.5	Congruential pseudo-random number generators	57
3.6	Further properties of congruential generators	61
3.7	Alternative methods of pseudo-random number generation	63
3.8	Summary and discussion	64
*3.9	Proof of the attainment of a full cycle for a particular mixed congruential pseudo-random number generator	65
3.10	Exercises and complements	67
4	Particular methods for non-uniform random variables	77
4.1	Using a central limit theorem	77
4.2	The Box–Müller and Polar Marsaglia methods	78
4.2.1	The Box–Müller method	78
*4.2.2	The Polar Marsaglia method	79
4.3	Exponential, gamma and chi-square variates	81
4.4	Binomial and Poisson variates	82
4.4.1	Binomial variates	82
4.4.2	Poisson variates	83
*4.5	Multivariate random variables	85
4.5.1	The bivariate Poisson distribution	85
4.5.2	The multivariate normal distribution	85
4.6	Discussion and further reading	86
4.7	Exercises and complements	87
5	General methods for non-uniform random variables	91
5.1	The ‘table-look-up’ method for discrete random variables	91
5.2	The ‘table-look-up’, or inversion method for continuous random variables	95
5.3	The rejection method for continuous random variables	98
5.4	The composition method	107
*5.5	Combining methods for simulating normal random variables	113
5.6	Discussion and further reading	119
*5.7	Additional approaches for normal random variables	120
5.8	Exercises and complements	124

6	Testing random numbers	137
6.1	Introduction	137
6.2	A variety of tests	139
6.3	Certain tests for uniform random digits	140
*6.4	Runs tests	143
6.5	Repeating empirical tests	145
6.6	Tests of non-uniform random variables	148
6.6.1	Normal variables	149
*6.6.2	Multivariate normal variables	149
6.6.3	Exponential and Poisson variables	150
6.7	Discussion	151
6.8	Exercises and complements	151
7	Variance reduction and integral estimation	160
7.1	Introduction	160
7.2	Integral estimation	162
7.2.1	Hit-or-miss Monte Carlo	163
7.2.2	Crude Monte Carlo	163
7.2.3	Using an antithetic variate	165
*7.2.4	Reducing variability	166
*7.2.5	Importance sampling	168
7.3	Further variance-reduction ideas	171
7.3.1	Control variates	171
*7.3.2	Using simple conditioning	172
7.3.3	The M/M/1 queue	173
*7.3.4	A simple random walk example	180
7.4	Discussion	181
7.5	Exercises and complements	182
8	Model construction and analysis	190
8.1	Basic elements of model simulation	190
8.1.1	Flow diagrams and book-keeping	190
8.1.2	Validation	192
8.2	Simulation languages	192
8.3	Markov models	193
8.3.1	Simulating Markov processes in continuous time	193
8.3.2	Complications	196
*8.4	Measurement of error	199
8.5	Experimental design	201
8.6	Discussion	205
8.7	Exercises and complements	205

9	Further examples and applications	209
9.1	Simulation in teaching	209
9.1.1	Simulation in MINITAB	209
9.1.2	Simulating a finite Markov chain	211
9.1.3	Teaching games	213
9.2	Estimation and robustness in ecology	213
9.3	Simulation in multivariate analysis	216
9.3.1	Linear discriminant analysis	216
9.3.2	Principal component analysis	217
9.3.3	Non-metric multidimensional scaling	218
9.3.4	Cluster-analysis	220
9.4	Estimating sampling distributions	221
9.4.1	The chi-square goodness-of-fit test	221
*9.4.2	Precision and the use of control variables	223
*9.5	Additional topics	227
9.5.1	Monte-Carlo testing	228
9.5.2	The bootstrap	228
9.6	Discussion and further reading	229
9.7	Exercises and complements	230
Appendix 1	Computer algorithms for generation, testing and design	236
A1.1	Generation routines available in NAG and IMSL	236
A1.2	Testing routines available in NAG and IMSL	246
A1.3	Features of the NAG and IMSL algorithms	248
A1.4	Further algorithms	248
Appendix 2	Tables of uniform random digits, and exponential and normal variates	250
	Solutions and comments for selected exercises	264
	Bibliography	307
	Author index	337
	Subject index	342
