

C o n t e n t s

1. General theory	6
1.1 Introduction	7
1.2 Tests based on a sequence of random variables	11
1.3 Tests based on a sequence of statistics	13
1.4 Sufficient sequences of statistics	18
1.5 Convergence properties of the likelihood ratio sequence	23
1.6 Conjugated parameter pairs	26
2. Likelihood ratio tests	41
2.1 The power function	46
2.1.1 The WALD approximation for the power function	48
2.1.2 The WALD approximations for the stopping bounds	52
2.1.3 A test for hypothesis $H_0: \theta \leq \theta^*$ against $H_1: \theta > \theta^*$	53
2.1.4 The slope of the power function	57
2.1.5 Upper bounds for the true risks	61
2.1.6 Bounds for the power function	63
2.2 Most powerful tests	67
2.3 Unbiased tests	76
2.4 Admissible tests	80
2.5 Monotone likelihood ratio families	92
2.6 The termination property	96
2.7 The average sample number function	99
2.8 The optimum property	104
3. The computation of the characteristics	107
3.1 Properties of the continuation region	109
3.2 The computation of the characteristics	112
3.3 The power function	119
3.4 The moments of the sample size	123
3.5 The distribution of the sample size	124
3.6 Admissible tests	126
3.7 Grouped observation	130
3.8 Characteristics of truncated tests	137
3.9 A continuous inspection scheme	143
4. Discrimination among $k > 2$ hypotheses	151
5. A sequential test for a simultaneous observation of several Bernoulli distributed random variables	155
