

CONTENTS

0. Introduction	1
0.1. The aim of the book,	1
0.2. About the merits of asymptotic expansions in statistical theory,	2
0.3. Why a special volume on asymptotic expansions of second order?	5
0.4. Methodological considerations,	8
0.5. The main results,	10
0.6. Notations,	14
1. Differentiability of paths	18
1.1. Introduction,	18
1.2. First order differentiability,	20
1.3. First order differentiability with rates,	29
1.4. Some technical lemmas for $DCC_{b,c}$ -differentiability,	34
1.5. Local asymptotic normality with rates,	40
1.6. Second order differentiability of paths,	45
1.7. Second order DCC- and Hellinger differentiability,	52
1.8. Differentiability in b -mean,	54
2. Methodological remarks about derivatives and tangent spaces	57
2.1. Introduction,	57
2.2. Derivatives of derivatives,	62
2.3. Reparametrizations,	65
2.4. Uniqueness of second derivatives,	68
2.5. A product tangent space,	77

3.	Examples of derivatives and tangent spaces	86
3.1.	Parametric families,	86
3.2.	Full families,	92
3.3.	Families of symmetric probability measures,	96
3.4.	Product measures,	101
4.	Differentiability of functionals	105
4.1.	Basic concepts,	105
4.2.	Paths through vector fields,	110
4.3.	Second gradients of real-valued functionals,	114
4.4.	Canonical gradients,	119
4.5.	Second gradients for functions of functionals,	124
4.6.	Historical remark,	126
5.	Examples of functionals and gradients	128
5.1.	Parametric families,	128
5.2.	Von Mises functionals,	136
5.3.	Minimum contrast functionals,	140
5.4.	L-functionals,	147
5.5.	Quantiles,	149
6.	Asymptotic expansions for power functions	153
6.1.	Auxiliary results,	153
6.2.	The second order envelope power function for simple hypotheses,	161
6.3.	The second order envelope power function for composite hypotheses,	172
6.4.	First order efficient test-sequences are usually second order efficient,	179
6.5.	Second order efficiency in one direction implies second order efficiency in the half space spanned by this direction over the hypothesis,	182
6.6.	Testing hypotheses on functionals,	193

7. Evaluating the performance of estimators 198
- 7.1. Introduction, 198
 - 7.2. Randomized estimators, 199
 - 7.3. Concentration, 202
 - 7.4. Unbiasedness, 205
 - 7.5. Spread, 209
 - 7.6. Comparisons on families of probability measures, 212
 - 7.7. Multidimensional estimators, 214
 - 7.8. Centering multidimensional probability measures, 217
 - 7.9. Asymptotic comparisons, 219
 - 7.10. Comparing multidimensional Edgeworth measures, 227
 - 7.11. Comparing one-dimensional Edgeworth measures, 231
 - 7.12. Functions of efficient estimators are efficient, 235
 - 7.13. Joint efficiency and componentwise efficiency, 242
8. Asymptotic bounds for the performance of confidence procedures and estimators 245
- 8.1. How to measure the quality of a confidence procedure, 246
 - 8.2. Second order bounds for the concentration of confidence bounds and median unbiased estimators, 249
 - 8.3. Second order bounds for the concentration of confidence bounds and estimators, the distribution of which admits an asymptotic expansion, 255
 - 8.4. Interpretation of concentration bounds in terms of spread, 262
 - 8.5. On local uniformity, 266
 - 8.6. Second order bounds without local uniformity, 272
 - 8.7. First order efficient confidence bounds (and estimators) are usually second order efficient, 282

9. The possible forms of Edgeworth expansions for asymptotically efficient estimator-sequences 288
- 9.1. Introduction, 288
 - 9.2. The possible forms of Edgeworth expansions: The general case, 291
 - 9.3. The possible forms of Edgeworth expansions: A version without local uniformity, 296
 - 9.4. The possible forms of Edgeworth expansions: Parametric families, 300
 - 9.5. The basic result, 304
 - 9.6. Proof of the basic result for $p = 1$, 306
 - 9.7. Proof of the basic result for arbitrary p , 321
 - 9.8. Examples and counterexamples, 324
 - 9.9. Restriction to subfamilies, 330
10. Statistics with stochastic expansion 333
- 10.1. Introduction, 333
 - 10.2. Inherent relations for locally uniform stochastic expansions, 335
 - 10.3. Edgeworth expansions for the distribution of a statistic admitting a stochastic expansion, 341
 - 10.4. Tests based on test-statistics with stochastic expansion, 347
 - 10.5. Confidence bounds with stochastic expansion, 354
 - 10.6. Estimators with stochastic expansion, 360
 - 10.7. A method for obtaining asymptotically efficient estimator-sequences, 369
 - 10.8. Calibration, 372
 - 10.9. Further remarks on randomized tests and confidence procedures, 376
11. Examples 382
- 11.1. Parametric families, 382
 - 11.2. Functionals defined for all probability measures, 387
 - 11.3. Minimum contrast functionals, 393

11.4.	Estimating structural parameters in the presence of known nuisance parameters,	400
11.5.	Estimating structural parameters in the presence of unknown nuisance parameters,	408
11.6.	A special von Mises functional,	419
11.7.	Lattice distributions,	425
12.	Quantiles: An example of an irregular functional	428
12.1.	Introduction,	428
12.2.	Bounds for the concentration of confidence bounds,	429
12.3.	Confidence rays for quantiles,	432
12.4.	A bound of order $o(n^0)$ without local uniformity,	438
12.5.	Better confidence bounds without local uniformity,	441
13.	Lemmas	451
13.1.	Measurability,	451
13.2.	Unimodality,	453
13.3.	Probabilistic lemmas,	456
13.4.	Moderate deviations and smoothing,	460
13.5.	Normal approximation and Edgeworth expansions,	464
13.6.	Order statistics,	477
13.7.	Miscellaneous,	480
	References	487
