

CONTENTS

Chapter 1 Problems of Decision-Making under Uncertainty

1.1	Introduction	1
1.2	Preferences and uncertainties	3
1.3	Some challenging problems	6
1.4	Business decisions	7
1.5	Classification problems	8
1.6	Sampling inspection of quality	12
1.7	Estimation	13
1.8	Treatment selection	15
1.9	Negotiating contracts and tariffs	17
1.10	The problem of control	18

Chapter 2 The Language of Uncertainty: Basic Grammar

2.1	The pervasiveness of uncertainty	21
2.2	Model-building	23
2.3	The feature of stability	26
2.4	Record set	28
2.5	Events and records	30
2.6	Simple properties of relative frequency	33
2.7	Requirements of a probability model	35
2.8	Specification of a probability model	36
2.9	Examples of probability models	37

Chapter 3 The Language of Uncertainty: Towards Fluency

3.1	Models for compound experiments	42
3.2	Unrelated or independent experiments	43

3.3	Sequential experiments	50
3.4	Experiments with two-dimensional records	58
3.5	Induced experiments	65
3.6	Binomial trials	72
3.7	Average and expectation	76
3.8	A measure of spread	82
3.9	Properties of mean and variance	85
3.10	A probability glossary	90

Chapter 4 Models for Competitive Behavior

4.1	An illustrative game	92
4.2	Structure of a two-person game	95
4.3	Introduction of a new product formulated as a game	96
4.4	Simple and randomized strategies	98
4.5	Randomized strategy of opponent known to player: Bayesian strategies	100
4.6	Graphic representation of the analysis	105
4.7	Admissible and inadmissible strategies	108
4.8	Admissibility of Bayesian strategies	110
4.9	Randomized strategy of opponent unknown to player	112
4.10	The case of the pessimistic player (max–min)	113
4.11	The max–min approach to introducing a new product	117

Chapter 5 The Nature of Statistical Inference

5.1	The class of possible probability models	119
5.2	Measures of plausibility	123
5.3	Plausibilities before and after experimentation	124
5.4	Plausibility analysis of cell-estimation problem	131
5.5	Plausibility analysis of binomial trials	133
5.6	Plausible prediction	134
5.7	Difficulties of plausibility analysis	138
5.8	Hypothesis testing	139
5.9	Estimation	143
5.10	Minimum variance unbiased estimator	148
5.11	Maximum likelihood estimates	152

Chapter 6 The Structure of Statistical Decision Theory

6.1	The basic ingredients	155
6.2	The assessment of procedures	160
6.3	Admissible and inadmissible procedures	162
6.4	The structure of the decision problem	167
6.5	The introduction of additional information	171
6.6	Some comments on mathematics and philosophy	174
6.7	The construction of a Bayesian procedure	175
6.8	Statistical decision-making as a game	181

6.9	The rational man concept	182
6.10	Graphic investigation	183
6.11	Design or choice of experiment	185
6.12	Utility dependent on the outcome of the informative experiment	191
6.13	General utility structure dependent on action, state of nature, outcome observed, and experiment undertaken	196

Chapter 7 Applications and Extensions of Statistical Decision Theory

7.1	Decision trees	202
7.2	Loss structures	213
7.3	Relation of decision theory to statistical inference	214
7.4	Utility function involving a prediction assessment: prognosis analysis	217
7.5	Application to the negotiation of a wage structure	222
7.6	Application to the replacement problem	225
7.7	Applications to the choice of treatment	228
7.8	Application to selecting a quality improver	230
7.9	Sequential decision-making: construction of a stopping rule	232
7.10	A problem of process control	239
7.11	Sequential statistical decision-making	244

Chapter 8 History, Present Extensions, and Future Trends

8.1	A brief history	249
8.2	Recapitulation	254
8.3	Extensions	258
8.4	Relation to other disciplines	259
8.5	Future trends	263

Further Reading	265
----------------------------------	-----

Appendices

1.	Functions	269
2.	Summation Instructions	270
3.	Max and Min Instructions	271
4.	Weighted Averages	272

Index	277
