

Contents

Preface xiii

1. The Equation of a Straight Line
 - 1.1 Introduction 1
 - 1.2 An Example of a Negative Relationship 2
 - 1.3 An Example of a Positive Relationship 4
 - 1.4 The Slope and Y Intercept 5
 - Exercises 6

2. Linear Regression and Correlation
 - 2.1 Introduction 7
 - 2.2 The Mean and Variance of a Variable 8
 - 2.3 Finding the Values of a and b in the Regression Equation 11
 - 2.4 The Covariance and Orthogonal Variables 14
 - 2.5 The Residual and Regression Sums of Squares 16
 - 2.6 The Correlation Coefficient 18
 - 2.7 Mean Squares 19
 - 2.8 The Nature of r^2 and $1 - r^2$ 20
 - 2.9 The Correlation Coefficient and the Regression Coefficient 22
 - 2.10 Standard Error of the Regression Coefficient 22
 - 2.11 Tests of Significance 23
 - 2.12 Plotting of the Residuals, $Y - Y'$, Against X 25
 - Exercises 28

3. Standardized Variables and Partial and Semipartial Correlation Coefficients
 - 3.1 Introduction 31
 - 3.2 Transforming Variables into Standardized Variables 31

- 3.3 The Regression Equation with Standardized Variables 32
- 3.4 Partitioning the Total Sum of Squares 33
- 3.5 The Partial Correlation Coefficient 34
- 3.6 The Semipartial Correlation Coefficient 35
- 3.7 Higher Order Partial and Semipartial Correlation Coefficients and Multiple Regression 37
- Exercises 37

4. Multiple Regression and Correlation

- 4.1 Introduction 39
- 4.2 The Least Squares Equations for a and the Regression Coefficients 40
- 4.3 An Example with Two X Variables 41
- 4.4 Calculating $R_{Y.12}^2$ and b_1 and b_2 Using Correlation Coefficients 45
- 4.5 The Semipartial Correlation Coefficients $r_{Y(1.2)}$ and $r_{Y(2.1)}$ 46
- 4.6 Multiple Regression with Orthogonal X Variables 49
- 4.7 Test of Significance of R_{YY} 50
- 4.8 Test of Significance of b_1 and b_2 and the Equivalent Test of Significance of $r_{Y(1.2)}$ and $r_{Y(2.1)}$ 50
- 4.9 Plotting of Residuals 52
- Exercises 52

5. Matrix Calculations for Regression Coefficients

- 5.1 The Matrix Product $\mathbf{R}_{ij}^{-1} \mathbf{R}_{yi} = \hat{\mathbf{B}}_i$ 54
- 5.2 The Inverse of a Symmetric 2×2 Correlation Matrix 55
- 5.3 Calculation of the Values of \hat{b}_1 and \hat{b}_2 56
- 5.4 A Multiple Regression Problem with Three X Variables 57
- 5.5 Test of Significance of MS_{reg} and $R_{Y.123}$ 58
- 5.6 The Inverse of a Symmetric 3×3 Correlation Matrix 59
- 5.7 Calculating the Regression Coefficients for Standardized Variables 60
- 5.8 Calculation of R_{YY}^2 from the Values of \hat{b}_i and r_{Yi} 61
- 5.9 Obtaining the Regression Coefficients for Unstandardized Variables 61
- 5.10 The Standard Error of b_i 62
- 5.11 Calculating the Semipartial Correlation Coefficients 63
- 5.12 Values of the Semipartial Correlation Coefficients Based on Sequential Runs 64
- 5.13 Multicollinearity 65
- Exercises 66

6. Equivalence of the F Tests of the Null Hypotheses $\mu_1 - \mu_2 = 0$, $\rho = 0$, and $\beta = 0$
 - 6.1 The t Test for the Difference Between $k = 2$ Independent Means 68
 - 6.2 An Orthogonal Partitioning of SS_{tot} 69
 - 6.3 The F Test for the Difference Between $k = 2$ Independent Means 71
 - 6.4 Dummy Coding for an Experiment Involving $k = 2$ Treatments 72
 - 6.5 A Regression Analysis of the Data in Table 6.1 73
 - 6.6 F Test of the Null Hypotheses $\rho = 0$ and $\beta = 0$ 75
 - 6.7 Summary 75

Exercises 76

7. Completely Randomized Designs with One Treatment Factor
 - 7.1 The Analysis of Variance 78
 - 7.2 Dummy Coding 79
 - 7.3 The Multiple Regression Equation with Dummy Coding 80
 - 7.4 The Squared Multiple Correlation Coefficients 82
 - 7.5 Test of Significance of $R_{YY'}$ 82
 - 7.6 Multiple Regression Analysis with Nonorthogonal and Orthogonal X Variables 83
 - 7.7 $R_{YY'}^2$ with Orthogonal Coding 84
 - 7.8 Orthogonal Comparisons or Contrasts 85
 - 7.9 Orthogonal Partitioning of SS_T and SS_{reg} 87
 - 7.10 Orthogonal Coding for $k > 3$ Treatments with Equal n 's 87
 - 7.11 Equivalent Tests of Significance in a Multiple Regression Analysis 88

Exercises 88

8. A Completely Randomized Design with a Quantitative Treatment Factor
 - 8.1 Introduction 91
 - 8.2 Analysis of Variance for the Experiment 92
 - 8.3 Trend of the Y Means 93
 - 8.4 Coefficients for Orthogonal Polynomials 94
 - 8.5 The Regression Equation Using Coefficients for Orthogonal Polynomials 95
 - 8.6 Partitioning the Treatment Sum of Squares 96
 - 8.7 Multiple Regression Analysis of the Experiment Using Coefficients for Orthogonal Polynomials 97

- 8.8 Tests of Significance with a Multiple Regression Analysis 98
- 8.9 Multiple Regression Analysis of the Experiment Using
Powered X Vectors 100
- 8.10 Tests of Significance with Powered X Vectors 102
- Exercises 102

9. Factorial Experiments

- 9.1 The Nature of a Factorial Experiment with Two Factors 105
- 9.2 Analysis of Variance of the Data in Table 9.1 106
- 9.3 Tests of Significance 108
- 9.4 Graphs for Two-Factor Interactions 110
- 9.5 Multiple Regression Analysis of the Data in Table 9.1 111
- 9.6 Tests of Significance with a Multiple Regression Analysis 113
- 9.7 Analysis of Variance and Multiple Regression Analysis
for a Factorial Experiment with Three Levels of A
and Three Levels of B 114
- Exercises 115

10. A Repeated-Measure Design

- 10.1 Introduction 117
- 10.2 Analysis of Variance for a Repeated-Measure Design with $k = 2$
Treatments 118
- 10.3 Multiple Regression Analysis of the Experiment with $k = 2$
Repeated Measures 120
- 10.4 Analysis of Variance of a Repeated-Measure Design with $k = 4$
Treatments 123
- 10.5 Linear, Quadratic, and Cubic Components of SS_T 124
- 10.6 Multiple Regression Analysis of the Data in Table 10.1 125
- 10.7 Advantage of a Repeated-Measure Design 128
- 10.8 Assumptions in a Repeated-Measure Design 128
- Exercises 129

11. Split-Plot Designs

- 11.1 Nature of a Split-Plot Design 132
- 11.2 Analysis of Variance for a Split-Plot Design 132
- 11.3 Summary of the Analysis of Variance 134
- 11.4 Multiple Regression Analysis for a Split-Plot Design 135
- 11.5 Tests of Significance with a Multiple Regression Analysis 139
- 11.6 Multiple Regression Analysis with Subject Vectors 139
- Exercises 142

12. The Analysis of Covariance for a Completely Randomized Design
 - 12.1 Introduction 144
 - 12.2 Partitioning the Total Product Sum 147
 - 12.3 The Residual Sum of Squares Using the Regression Coefficients for Each Treatment 149
 - 12.4 The Residual Sum of Squares Using a Common Regression Coefficient 149
 - 12.5 Test for Homogeneity of the Regression Coefficients 150
 - 12.6 Test for Treatment Effects 151
 - 12.7 Multiple Regression Analysis of the Data in Table 12.2 153
 - 12.8 Test for Interaction 154
 - 12.9 Test for Treatment Effects 156
 - 12.10 Multiple Covariates 156
 - Exercises 157

13. Nonorthogonal Designs: Two-Factor Experiments
 - 13.1 Orthogonal Designs 160
 - 13.2 Nonorthogonal Designs 161
 - 13.3 A Population Model for a Two-Factor Experiment 163
 - 13.4 Effect Coding 163
 - 13.5 Estimates of the Model Parameters 164
 - 13.6 Squared Multiple R 's 167
 - 13.7 Squared Semipartial R 's and Tests of Significance 168
 - 13.8 Model Comparisons and Tests of Significance 172
 - 13.9 Unweighted Means Analysis of Variance 174
 - Exercises 176

14. Conditional Fixed-Effect Models
 - 14.1 A Conditional Fixed-Effect Model 178
 - 14.2 Sequential Ordering of X Vectors and Variables 179
 - 14.3 Orthogonal Product Vectors 180
 - 14.4 Nonorthogonal Product Vectors 181
 - 14.5 Trait-Treatment Interactions 183
 - 14.6 Pseudo-Orthogonal Designs 186
 - 14.7 The Analysis of Covariance for a Pretest-Posttest Design 188
 - Exercises 190

- References 193

- Answers to Selected Exercises 195

Appendix 201

Table I Table of t 202

Table II Values of F significant with $\alpha = .05$
and $\alpha = .01$ 205

Table III Table of coefficients for orthogonal
polynomials 208

Index 209
