
Contents

1. Introduction	1
1.1 Definitions, examples, and notation	1
1.2 Objectives of time-series analysis	10
1.3 More notation	11
1.4 Trend, serial dependence and stationarity	13
1.5 Duality between trend and serial dependence	16
1.6 Software	18
2. Simple descriptive methods of analysis	19
2.1 Time plots	19
2.2 Smoothing	21
2.3 Differencing	31
2.4 The autocovariance and autocorrelation functions	32
2.5 Estimating the autocorrelation function	39
2.6 Impact of trend removal on autocorrelation structure	45
2.7 The periodogram	47
2.8 The connection between the correlogram and the periodogram	55
3. Theory of stationary processes	58
3.1 Notation and definitions	58
3.2 The spectrum of a stationary random process	59
3.3 Linear filters	66
3.4 The autoregressive moving average process	71
3.5 Sampling and accumulation of stationary random functions	85
3.6 Implications of autocorrelation for elementary statistical methods	87
3.7 Further reading	92
4. Spectral analysis	94
4.1 Introduction	94
4.2 The periodogram revisited	95

4.3	Periodogram-based tests of white noise	98
4.4	The fast Fourier transform	101
4.5	Periodogram averages	103
4.6	Other smooth estimates of the spectrum	108
4.7	Adjusting spectral estimates for the effects of filtering	113
4.8	Combining and comparing spectral estimates	117
4.9	Fitting parametric models	124
4.10	Discussion: strengths and weaknesses of spectral analysis	127
4.11	Further reading	133
5.	Repeated measurements	134
5.1	Introduction	134
5.2	Repeated measurements as multivariate data	135
5.3	Incorporating time-series structure	138
5.4	Formulating the model: time plots and the variogram	142
5.5	Fitting the model: maximum likelihood estimation and testing	152
5.6	Case-study: analysis of data on protein content of milk samples	157
5.7	Further reading	163
6.	Fitting autoregressive moving average processes to data	165
6.1	Introduction: ARIMA processes as models for non-stationary time series	165
6.2	Identification	167
6.3	Estimation	172
6.4	Diagnostic checking	177
6.5	Case studies	182
6.6	Further reading	187
7.	Forecasting	188
7.1	Preamble	188
7.2	Forecasting by extrapolation of polynomial trends	190
7.3	Exponential smoothing	192
7.4	The Box–Jenkins approach to forecasting	194
7.5	Further reading	201
8.	Elements of bivariate time-series analysis	202
8.1	Introduction	202
8.2	The cross-covariance and cross-correlation functions	202

8.3 Estimating the cross-correlation function	204
8.4 The spectrum of a bivariate process	212
8.5 Estimating the cross-spectrum	215
8.6 Further reading	220
References	222
Appendix A. Data sets	228
A.1 Levels of luteinizing hormone in blood samples	228
A.2 Wool prices at weekly markets	229
A.3 UK deaths from bronchitis, emphysema, and asthma	238
A.4 Growth of colonies of <i>paramecium aurelium</i>	239
A.5 Body weights of rats under three different experimental treatments	240
A.6 Protein content of milk samples	241
A.7 Annual numbers of lynx trapped in the Mackenzie River district of north-west Canada from 1821 to 1934	244
Appendix B. Matrix approach to the general linear model	245
B.1 Definition of the general linear model	245
B.2 The multivariate Normal distribution	247
B.3 Least squares estimation	248
B.4 Properties of least squares estimates under a Normality assumption	248
B.5 Generalized least squares	249
B.6 Further reading	250
Appendix C. Complex numbers	251
C.1 Definitions	251
C.2 Polar representation of complex numbers	252
C.3 The complex exponential function	252
C.4 Further reading	253
