

Contents

1. Basic System Concepts	1
1.1 Introduction	1
1.2 State-Space Representation	5
1.3 Operators	6
1.4 Linearity	9
1.5 Stationarity	10
1.6 System Equivalence	10
1.7 Controllability and Observability	11
2. Analysis in Discrete-Time Domain	14
2.1 Introduction	14
2.2 System Weighting Sequence	14
2.3 Transmission Matrices	17
2.4 Characterization in Terms of State Variables	19
2.5 Formulation of State Equations	22
2.6 Transformation of Coordinates	27
2.7 Jordan Canonical Form	30
2.8 Conditions for Controllability and Observability	32
3. Transformation Calculus	36
3.1 Introduction	36
3.2 The Generating Function	36
3.3 Transformation of the Convolution Summation	39
3.4 The \mathcal{Z} Transform	41
3.5 Determination of \mathcal{Z} Transforms	42
3.6 The Inverse Transformation	47
3.7 Inversion by Partial-Fraction Expansion	48
3.8 The Inversion Integral	50
3.9 Initial-Value Determination for a \mathcal{Z} Transform	54
3.10 Intermediate-Value Determination for a \mathcal{Z} Transform	55
3.11 Final-Value Determination for a \mathcal{Z} Transform	55
3.12 Example of a Problem in Probability Theory	56
3.13 \mathcal{Z} Transform of the Product $f(k)h(k)$	57
3.14 Parseval's Theorem	58
3.15 Relation to the Laplace Transform	59

4. Sampling of Continuous-Time Functions	66
4.1 Introduction	66
4.2 Laplace Transform of a Sampled Continuous-Time Function	66
4.3 Alternate Form of $\mathcal{L}[f(t; T)]$	71
4.4 The Sampling Theorem	73
4.5 Extensions of the Sampling Theorem	76
4.6 Periodic Nonuniform Sampling	77
4.7 Uniform Sampling of a Function and Its Derivatives	82
4.8 Nonuniform Sampling	85
4.9 \mathcal{Z} Transforms for Shifted Time Functions	89
4.10 Multidimensional Sampling	92
5. Polynomial Interpolation and Extrapolation	97
5.1 Introduction	97
5.2 Polynomial Interpolation	97
5.3 Lagrangian Polynomials	98
5.4 Approximation Error	102
5.5 Newton-Gregory Extrapolation	103
5.6 Zero-Order Extrapolation	106
5.7 First-Order Extrapolation	106
5.8 Second-Order Extrapolation	108
5.9 Frequency-Domain Characteristics of Extrapolation Functions	108
6. Continuous-Time Systems with Discrete-Time Inputs	112
6.1 Introduction	112
6.2 Transition Equation of a Continuous-Time System	112
6.3 System Transition Equation for Discrete-Time Inputs	115
6.4 Systems Characterized by Transfer Functions	118
6.5 Approximate Inversion of $Y(s)$	119
6.6 Determination of Samples of Output, $y(kT)$	120
6.7 Determination of Output at Increased Sampling Rates	122
6.8 Exact Inversion of $Y(s)$	124
6.9 Determination of Output by Means of Modified \mathcal{Z} Transform	129
7. Sampled-Data Control Systems	131
7.1 Introduction	131
7.2 Block Diagram Representation	132
7.3 Signal Flow Graph Analysis	136
7.4 Transition Equations for Sampled-Data Systems	141

7.5	Illustrative Example	149
7.6	Special Cases of Sampling and "Hold" Extrapolation	154
7.7	System Stability	157
7.8	Stability of an Equilibrium State	158
7.9	Stability of Linear, Stationary Systems	162
7.10	Application of Liapunov's Theorem	163
7.11	Stability in the Presence of an Input	168
7.12	Reducible Nonstationary and Nonlinear Systems	169
7.13	Stability Criteria	171
8.	Discrete Stochastic Processes	178
8.1	Introduction	178
8.2	Definitions of Basic Terms	179
8.3	System Relations for the Correlation Sequences	182
8.4	Discrete-Process Spectral Density Functions	182
8.5	System Design for Minimum Mean-Square Error	185
8.6	Stochastic Finite-State Systems	190
8.7	Types of Markov Systems	195
8.8	Markov Systems with Cost Functions	198
8.9	Controllable Markov Systems	201
8.10	Optimum Control of Markov Systems	202
Appendix A	Numerical Method for \mathcal{Z}-Transform Inversion	213
Appendix B	\mathcal{Z}-Transform Tables	216
Problems	221
INDEX	237
