1	The analysis of spatial systems	1
1.1	Objectives of space–time systems analysis	2
1.2	The structure of systems	4
1.3	Examples of space–time systems	8
1.4	Stages in analysis of spatial systems	20
1.5	Experimental design in analysis of space–time systems	23
	1.5.1 Choice of variables	24
	1.5.2 Error sources and design	25
	1.5.3 Design with experimental versus operating records	27
	1.5.4 The effects of sampled observations and choice of sampling design	29
1.6	Conclusion	33

Part 1 Time Series

2	The structure of spatial systems and their representation	
2.1	The structure of univariate systems	34
	2.1.1 The system input	34
	2.1.2 The system transfer function	37
	2.1.3 The system output	45
2.2	The structure of multivariate and space–time systems	51
	2.2.1 The structure of multivariate systems	52
	2.2.2 The structure of space–time systems	57
2.3	The mathematical representation of systems	62
	* 2.3.1 Difference-equation representation	65
	* 2.3.2 Differential-equation representation	68
	* 2.3.3 Transfer-function integral-equation representation	70
	2.3.4 State-space representation	72
2.4	Complications to the practical analysis of system structure	77
	2.4.1 Observable and unobservable systems elements	77
	2.4.2 Observability, controllability, and the minimal realisation problem	81
	2.4.3 Causes and consequences of the presence of stochastic elements	86
2.5	Transfer-function representation and mathematical approximants	92
2.6	Conclusion	94
3	Identification and specification of systems	
3.1	System specification and inference	96
3.2	Time domain univariate identification	99
	* 3.2.1 Theoretical time domain identification diagnostics	100
	* 3.2.2 Estimates of time domain identification diagnostics	104
3.3	The treatment of nonstationarity and nonlinearity in system identification	110
	3.3.1 Nonlinearity	111
	3.3.2 Nonstationarity	113
3.4	Cases of time domain identification	128
	3.4.1 Identification of unknown system transfer function	128
	3.4.2 Univariate identification of unknown output (convolution)	145

3.4 (continued)		
3.4.3	Univariate identification of unknown input (deconvolution)	148
3.4.4	Identification of autoregressive moving-average (ARMA) processes	150
3.4.5	System simulation	162
3.5	System identification in the frequency domain	164
3.5.1	Frequency domain univariate identification diagnostics	165
3.5.2	Aliasing and bandwidth	172
3.5.3	Estimators of the system frequency-response functions	173
3.5.4	Tests of significance of spectral and cross-spectral estimates	183
3.6	Cases of frequency-response identification	187
3.6.1	Identification of unknown transfer functions	187
3.6.2	Identification of ARMA processes	195
3.6.3	Univariate identification: conclusion	201
3.7	Multivariate identification	
3.7.1	Time domain multivariate identification diagnostics	202
3.7.2	Multivariate transfer-function identification	205
3.7.3	Frequency domain multivariate identification diagnostics	208
3.7.4	Multivariate transfer-function identification	210
3.8	Conclusion	212
4	Estimation of system parameters	214
4.1	Properties of parameter estimators	221
4.2	Least-squares (OLS) parameter estimation	226
4.2.1	OLS estimation: univariate case	226
4.2.2	OLS estimation: multivariate case	238
4.2.3	Estimation of noise models	241
4.2.4	Assumptions of the least-squares method	244
4.2.5	Difficulties in least-squares estimation	245
4.3	Diagnostic checking of estimates	254
4.3.1	Diagnostic checks of models of a given order	254
4.3.2	Sequential estimation and checking	261
4.4	Recursive estimation procedure	268
4.4.1	Recursive least-squares (ROLS) estimation	268
4.4.2	Recursive multivariate least-squares estimation	274
4.4.3	Bayesian estimation	274
4.5	Special estimators: univariate case	277
4.5.1	Generalised least-squares (GLS) estimation	278
4.5.2	Instrumental variable (IV) estimation	280
4.5.3	Stochastic approximation (including maximum-likelihood) estimation	287
4.6	Special estimators: multivariate case	298
4.6.1	Two-stage least-squares (2SLS) estimation	300
4.6.2	Three-stage least-squares (3SLS) estimation	303
4.6.3	Stochastic approximation	306
4.6.4	Canonical solutions to multivariate estimation problems	308
4.6.5	Special estimators: conclusion	313

4.7	Relations between identification and estimation	314
4.7.1	Univariate identifiability criteria	315
4.7.2	Multivariate identifiability criteria	319
4.8	Conclusion	320
5	Parameter mapping: analysis of nonstationary and nonlinear systems	
5.1	Introduction	323
5.1.1	Global analysis and parameter mapping	323
5.1.2	A representation of parameter maps	328
5.1.3	Continuous parameter models	331
5.1.4	Discontinuous parameter models	333
5.1.5	Systematic parameter models	333
5.1.6	Observability restrictions and parameter mapping: classes of parameter dynamics	334
5.2	Recursive simulation (<i>class 1</i> dynamics)	337
5.3	Parameter reconstruction (<i>class 2</i> dynamics): the Luenberger observer	341
5.4	Stochastic parameter reconstruction (<i>class 3</i> dynamics): the Kalman observer	346
5.5	Predictor–corrector estimates of stochastic system equation (<i>class 4</i> and <i>class 5</i> dynamics): the Kalman filter	350
5.6	Adaptive estimation of transfer-function parameters (<i>class 6</i> dynamics)	357
5.6.1	Dynamic parameter estimation by window functions	359
5.6.2	Dynamic parameter estimation by error bounding	365
5.6.3	Dynamic parameter estimation by an adaptive estimator	367
5.7	Adaptive estimation of ARMA systems (<i>class 7</i> dynamics)	389
5.8	Tests of significance of parameter regimes	391
5.8.1	Recursive treatment of parameter tests	392
5.8.2	Block treatment of parameter discontinuity	396
5.9	Parameter mapping: conclusion	402

Part 2 Spatial Time Series

6	Space–time systems: representation, identification, and estimation	404
6.1	The structure of space–time systems	405
6.1.1	Space–time system input	406
6.1.2	Space–time system transfer function	408
6.1.3	Space–time system output	415
6.2	The mathematical representation of space–time systems	418
* 6.2.1	Space–time difference-equation representation	418
* 6.2.2	Space–time differential-equation representation	421
* 6.2.3	Space–time integral-equation representation	422
* 6.2.4	Space–time state-variable representation	423

6.3	Complications in the analysis of space–time systems	425
6.3.1	Observable and unobservable space–time system components	425
6.3.2	Observability, controllability, and minimal space–time realisations	426
6.3.3	The effect of sampling interval constraints on space–time analysis	428
6.3.4	Boundary values	430
6.3.5	The entry of stochastic elements into space–time systems	431
6.4	Specification of space–time systems	433
6.4.1	Estimates of space–time response functions and tests of significance	435
6.4.2	System specification methods	437
6.4.3	Examples of spatial system specification	443
6.5	Estimation of space–time systems	446
6.5.1	OLS estimation of space–time systems	447
6.5.2	OLS estimation of space–time transfer-function systems	452
6.5.3	OLS estimation of space–time ARMA systems	454
6.5.4	Problems in OLS estimation of spatial systems	455
6.6	Conclusion	457
7	The estimation of spatial systems and purely spatial processes	
7.1	Special estimators of spatial systems	459
7.1.1	Special spatial estimators	459
7.1.2	Canonical solution	462
7.1.3	Examples of special spatial estimation	463
7.2	Parameter mapping and spatial systems	470
7.2.1	Classes of spatial parameter dynamics	471
7.2.2	Examples of spatial parameter mapping	473
7.3	Special space–time processes	477
* 7.3.1	The mathematical solution of special space–time systems	485
7.3.2	Nonstationarity of level in special space–time systems	488
7.3.3	Identification of special space–time systems	490
7.3.4	Estimation of special space–time processes	497
7.4	Purely spatial processes	499
7.4.1	Purely spatial transfer-function and ARMA models	503
7.4.2	Identification of purely spatial processes	504
7.4.3	Estimation of purely spatial processes	509
7.5	Conclusion	531

Part 3 Forecasting and Control

8	Forecasting and control in space–time systems	
8.1	The motivation for forecasting and control	533
8.1.1	Forecasting	533
8.1.2	Control	536
8.2	Mathematical forecasting in univariate systems	539
8.2.1	Forecasting with extrapolation (naive) models	539
8.2.2	Forecasting with regression models	544
8.2.3	Univariate ARMA forecasting	549
8.2.4	Univariate transfer-function forecasting	552
8.2.5	Comparison of forecasting methods	557

8.3	Forecasting system changes (adaptive forecasting)	560
8.3.1	The Kalman linear predictor	561
8.3.2	Examples of Kalman linear prediction	563
8.3.3	Comparison of adaptive forecasting methods	567
8.4	Mathematical forecasting in multivariate systems	567
8.5	Spatial mathematical forecasts	568
8.6	Evaluation of forecasts	573
8.6.1	Absolute forecasting accuracy	573
8.6.2	Relative forecasting accuracy	576
8.7	Types of control systems	577
8.7.1	Suboptimal control systems	579
8.7.2	Optimal control systems	581
8.7.3	Optimal one-stage quadratic control systems	585
8.7.4	Optimal T -stage quadratic control systems	592
8.7.5	Space-time control systems	594
8.8	Interrelations between system identification estimation and control	600
8.8.1	Identification and estimation in controlled systems	601
8.8.2	Derivation of controllers in estimated systems	603
8.9	Forecasting and control: conclusion	610
9	Future developments in spatial analysis, forecasting, and control	
9.1	Inductive versus deductive approaches	612
9.2	Large versus small models	613
9.3	Long- versus short-term forecasting and model building	614
9.4	Future research directions	616
Appendices		
Appendix 1.1	Notation	619
Appendix 1.2	Data sequences	623
Appendix 2.1	Simple matrix algebra	629
Appendix 2.2	Mathematical operations	636
Appendix 2.3	Observability, controllability, and minimal realisations	641
