Preface	<i>Page</i>	ix
Acknowledgements		xi
Notation		xii
Standard Distributions		xiv
Introduction		1
1 Sufficiency		
1.1 Introduction		9
1.2 Factorization criterion		13
1.3 Distribution of statistics conditional on a sufficient statistic		16
1.4 Joint sufficiency		16
1.5 Minimal sufficiency		19
2 Unbiased point estimators		
2.1 Introduction		23
2.2 Rao–Blackwell theorem		27
2.3 The role of sufficient statistics		29
2.4 Completeness		31
2.5 Joint completeness		33
2.6 Sufficiency, completeness and independence		36
2.7 Minimum-variance bounds		40
2.8 Computation of a minimum-variance bound		44
2.9 Minimum attainable variance		45
2.10 Mean square error		47
2.11 Two parameters		48

3 Elementary decision theory and Bayesian methods

3.1	Comments on classical techniques	52
3.2	Loss functions	53
3.3	Decision theory	55
3.4	Bayes decisions	59
3.5	Using data	63
3.6	Computing posterior distributions	67
3.7	Conjugate distributions	72
3.8	Distribution of the next observation	74
3.9	More than one parameter	75
3.10	Decision functions	77
3.11	Bayes estimators	80
3.12	Admissibility	82

4 Methods of estimation

4.1	Introduction	85
4.2	Maximum likelihood estimation	86
4.3	Locating the maximum likelihood estimator	87
4.4	Estimation of a function of a parameter	88
4.5	Truncation and censoring	90
4.6	Estimation of several parameters	92
4.7	Approximation techniques	94
4.8	Large-sample properties	97
4.9	Method of least squares	100
4.10	Normal equations	104
4.11	Solution of the normal equations (non-singular case)	106
4.12	Use of matrices	107
4.13	Best unbiased linear estimation	108
4.14	Covariance matrix	111
4.15	Relaxation of assumptions	113

5 Hypothesis testing I

5.1	Introduction	116
5.2	Statistical hypothesis	118
5.3	Simple null hypothesis against simple alternative	120
5.4	Applications of the Neyman-Pearson theorem	125
5.5	Uniformly most powerful tests for a single parameter	130
5.6	Most powerful randomized tests	132

5.7	Hypothesis testing as a decision process	133
5.8	Minimax and Bayes tests	138
6	Hypothesis testing II	
6.1	Two-sided tests for a single parameter	140
6.2	Neyman-Pearson theorem extension (non-randomized version)	141
6.3	Regular exponential family of distributions	145
6.4	Uniformly most powerful unbiased test of $\theta = \theta_0$ against $\theta \neq \theta_0$	146
6.5	Nuisance parameters	149
6.6	Similar tests	150
6.7	Composite hypotheses—several parameters	155
6.8	Likelihood ratio tests	159
6.9	Bayes methods	165
6.10	Loss function for one-sided hypotheses	165
6.11	Testing $\theta = \theta_0$ against $\theta \neq \theta_0$	169
7	Interval estimation	
7.1	One parameter, Bayesian confidence intervals	173
7.2	Two parameters, Bayesian confidence regions	175
7.3	Confidence intervals (classical)	177
7.4	Most selective limits	180
7.5	Relationship to best tests	181
7.6	Unbiased confidence intervals	182
7.7	Nuisance parameters	184
7.8	Discrete distributions	185
7.9	Relationship between classical and Bayesian intervals	187
7.10	Large-sample confidence intervals	187
	Appendix 1 Functions of random variables	
A1.1	Introduction	193
A1.2	Transformations: discrete distributions	194
A1.3	Continuous distributions	196
A1.4	The order statistics	202
	Appendix 2 The regular exponential family of distributions	
A2.1	Single parameter	207
A2.2	Several parameters	210

viii *Contents*

A2.3 The regular exponential family of bivariate distributions	211
Further exercises	214
Brief solutions to further exercises	229
Further reading	242
Author index	243
Subject index	244
