Preface	<i>Page</i>	ix
1 Introduction		1
1.1 Sequential experiments		1
1.2 Sampling inspection		4
1.3 Properties of the curtailed inspection plan		7
1.4 Loss and risk functions		11
Problems		12
2 The sequential probability ratio test		15
2.1 Origin of the SPRT		15
2.2 Derivation of the SPRT		15
2.3 Some important properties of the SPRT		18
2.4 Some applications of the SPRT		24
Problems		30
3 Sequential tests between three hypotheses		35
3.1 Two examples		35
3.2 Formulation of the test		36
3.3 Properties of Sobel and Wald's test		39
3.4 Armitage's method		40
3.5 Billard and Vagholkar's test		43
3.6 Some special methods of treating three hypotheses		46
3.7 Application of the methods		47
Problems		48
4 Extensions to the SPRT		49
4.1 The problem of composite hypotheses		49
4.2 Wald's theory of weight functions		50
4.3 Some applications of Wald's theory of weight functions		52
4.4 Transformation of observations		57

4.5	Cox's theorem	58
4.6	Discussion	61
4.7	Asymptotic tests	62
	Problems	66
5	Some applications of Cox's theorem	69
5.1	The sequential t -test	69
5.2	Two-sided tests	70
5.3	Closed forms of the tests	73
5.4	Use of the tests	74
5.5	A sequential test of randomness	75
5.6	Sequential analysis of variance	80
5.7	Sequential χ^2 and T^2	82
	Problems	83
6	Some methods leading to closed boundaries	85
6.1	Review of Chapters 1-5	85
6.2	Armitage's 'restricted' procedures	85
6.3	Approximate solution by diffusion theory	87
6.4	Application to tests for binomial probability	88
6.5	Contraction of the middle boundary	89
6.6	Boundaries to minimize the maximum expected sample size	91
6.7	Discussion of Armitage's methods	91
	Problems	94
7	Decision theory	97
7.1	Introduction	97
7.2	Decision-theoretic approach to sampling inspection	97
7.3	Bayesian approach	103
7.4	Design of a sequential sampling plan	108
7.5	Three terminal decisions	116
7.6	Empirical Bayes solutions	117
7.7	The minimax criterion	120
7.8	Discussion	124
	Problems	125
8	Sequential estimation	129
8.1	Estimation versus hypothesis testing	129
8.2	Estimation	132

8.3	Inverse binomial sampling	136
8.4	Asymptotic boundary theory	141
8.5	Bayesian decision theory approach to sequential estimation	143
8.6	Discussion	149
8.7	Risk-efficient estimators	150
8.8	Sequential interval estimation	151
8.9	Bayesian decision theory approach to sequential interval estimation	155
	Problems	157
9	Sequential estimation of points on regression functions	161
9.1	Introduction	161
9.2	The Robbins–Monro process	162
9.3	Dvoretzky’s theorem	167
9.4	Practical use of the Robbins–Monro process	169
9.5	The Kiefer–Wolfowitz procedure	171
9.6	Methods for seeking the maximum of a response surface	175
	Problems	177
10	Sequential estimation of points on quantal response curves	181
10.1	Introduction	181
10.2	The Robbins–Monro process	182
10.3	The up-and-down rule	185
10.4	Modifications to the up-and-down rule	189
10.5	Finite Markov chain approximation	191
10.6	Wetherill’s UDTR rule	194
	Problems	198
11	Double sampling	199
11.1	Double sampling (sampling inspection)	199
11.2	Estimation by double sampling	201
11.3	Choice of the second sample size in double sampling	206
11.4	Stein’s double sampling plan	208
	Problems	210
12	Sequential allocation and selection problems	213
12.1	Bandit problems – exploration versus exploitation	213
12.2	Adaptive allocation procedures for clinical trials	223
12.3	Allocation procedures to achieve balance	229

12.4	Screening for drugs	231
12.5	Selection of the largest of k normal means	233
	Problems	236
Appendix	The normal diffusion process	239
References I	General	241
	II Applications	255
