Preface *Page* vii

Acknowledgments ix

PART I: THEORETICAL TREATEMENT

1. Introduction 3
1.1 Abundance models 3
1.2 Some distributions used in the statistical analysis of abundance and diversity 4
1.3 Description of fixed populations 7
1.4 Description of random populations 12

2. Sampling from a Population of Classes 16
2.1 Introduction 16
2.2 The limitation of inference drawn from one sample 18
2.3 Sampling from a finite population 23
2.4 Sampling from an infinite population 25
2.5 Quadrat sampling: presence absence data 28
2.6 Species-area curves 29
2.7 Good's (empirical) Bayesian approach 30

3. Abundance Models 34
3.1 General introduction 34
3.2 Maximum liklihood theory applied to symmetric models 37
3.3 Fisher's logarithmic series model 38
3.4 The negative binomial model 45
3.5 The geometric series model 55
3.6 The Poisson lognormal model 57
3.7 Zipf's model 60
3.8 Some other models 63
3.9 Some concluding remarks 64

4. Sample Coverage 67
4.1 Introduction 67

4.2 Finite populations 68
4.3 Infinite populations 70
4.4 Some results for the negative binomial model 71

5. Indices of Diversity and Equitability **74**
5.1 Introduction 74
5.2 Finite populations 74
5.3 Infinite populations 75
5.4 Parameter transformation 77

PART II: ECOLOGICAL APPLICATIONS

6. Abundance Models in Ecology **85**
6.1 Introduction 85
6.2 Some historical remarks 85
6.3 Interpretations of fixed and random models in ecology 87
6.4 The stability of population parameters 92

7. Abundance Models in Ecology—Examples **94**
7.1 Discussion of assumptions 94
7.2 Judging goodness of fit 97
7.3 Quadrat sampling 102
7.4 Higher order classification 107
7.5 Species diversity of chironomid communities—an example 108
