

CONTENTS

PREFACE	v
1 ORIGINS, PURPOSES AND LIMITATIONS	1
The beginnings of factor analysis	3
First in the field	5
Purposes of factor analysis in relation to the behavioural sciences	6
Descriptive analysis	7
Testing and creating hypotheses	8
Limitations	10
2 A GEOMETRICAL APPROACH TO FACTOR ANALYSIS	13
Correlations	13
The cosine of an angle is equal to the correlation coefficient	18
Vectors and correlation matrices	20
Vector resolution	23
The geometry of the Centroid (or simple summation method of factor analysis)	26
3 THE LANGUAGE AND INTERPRETATION OF FACTOR ANALYSIS	31
Variance	31
Communality	35
Factor and component analysis	36

A factor analysis	38
Criteria for the number of factors to be extracted	43
Criteria for the significance of factor loadings	45
Interpreting a factor matrix	46
4 THE ROTATION OF FACTORS	51
Direct and derived solutions	51
The names of some direct methods	52
Rotation (or multiple-factor solutions)	53
Thurstone's theory of simple structure	55
Factor rotation (orthogonal)	57
A note on second- and higher-order factors	60
The names of some derived methods	61
Rotation of the IQ and divergent test matrix	61
5 SOME APPLICATIONS	67
Human ability	67
Personality	74
Osgood's Semantic Differential	78
An example from experimental psychology	80
The derivation of Local and Cosmopolitan scales	82
Medicine and public health	84
APPENDICES	
A Finding factor loadings using simple summation method	89
B Significance levels for Pearson product-moment correlation coefficients	95
C Significance levels of factor loadings using the Burt-Banks formula	97
SUGGESTED FURTHER READING	101
INDEX	103
