Contents

1 The Classical Variational Principles of Mechanics

J. T. Oden **1**

1.1 Introduction. 1
1.2 Mathematical preliminaries 2
1.3 Green's formulae for operators on Hilbert spaces 6
1.4 Abstract variational boundary-value problems. 12
1.5 Construction of variational principles. 18
1.6 The classical variational principles 19
1.7 Applications in elasticity 23
1.8 Dual principles 27

2 Approximation of Three-Dimensional Models by Two-Dimensional Models in Plate Theory

P. G. Ciarlet and P. Destuynder **33**

2.1 Introduction. 33
2.2 The three-dimensional problem 34
2.3 Formal construction of approximations. 38
2.4 Computation of the term (σ^{-2}, u^{-2}) 41
2.5 Computation of the term (σ^{-1}, u^{-1}) 43
2.6 Conclusions 44

3 The Global Constant Strain Condition and the Patch Test

A. Samuelsson **47**

3.1 Introduction. 47
3.2 The Kirchhoff plate problem 48
3.3 The global constant strain condition 49
3.4 The patch test. 51
3.5 Examples 52
3.6 Concluding remarks 56

4 The Influence of the Finite Element Method on Developments in Structural Dynamics

G. B. Warburton **59**
4.1 Introduction 59
4.2 Matrix equation for linear structures 60
4.3 Natural frequencies and reduction methods 62
4.4 Response 64
4.5 The normal mode method 65
4.6 Numerical integration methods 70
4.7 Dynamic interaction problems 74
4.8 Concluding remarks 77

5 Marriage *à la mode*—The Best of Both Worlds (Finite Elements and Boundary Integrals)

O. C. Zienkiewicz, D. W. Kelly, and P. Bettess **81**
5.1 Introduction 81
5.2 The discretization procedures 83
5.3 The trial functions 85
5.4 Trefftz elements for mixed solution procedures 87
5.5 Surface interpolation for the Trefftz elements 93
5.6 The patch test and convergence 93
5.7 Computational expenditure 97
5.8 Examples 98
5.9 Concluding remarks 104

Appendix: The equivalence of the direct and indirect boundary integral equations 105

6 On Compatible and Equilibrium Models with Linear Stresses for Stretching of Elastic Plates

D. J. Allman **109**
6.1 Introduction 109
6.2 The compatible displacement model with linear stresses . 111
6.3 A linear equilibrium stress field with nine stress parameters 113
6.4 Calculation of the equilibrium element stiffness matrix . . 117
6.5 Calculation of the element stresses 119
6.6 Numerical applications and comparisons 119

Appendix: Integration formulae for an element subregion 124

7 Note on a Finite Element Stiffness Formulation in Shell Theory

L. S. D. Morley **127**
7.1 Introduction 127
7.2 Basic trial functions in first approximation shell theory . 128
7.3 Choice of connectors for a hybrid finite element model . 135
7.4 Element stiffness matrix 140
7.5 Interpolation of connectors 143
7.6 Edge effect 146
7.7 Conclusions 150

8 Complementary Energy with Penalty Functions in Finite Element Analysis

R. L. Taylor and O. C. Zienkiewicz **153**
8.1 Introduction 153
8.2 Governing equations 154
8.3 Stress formulation 156
8.4 Relationship of penalty function formulations with mixed variational principles—recovery of displacements 159
8.5 Finite element implementation for two-dimensional plane linear elastic analysis 160
8.6 Recovering a continuous displacement field 164
8.7 Numerical examples 165
8.8 Closure 172

9 Dual Finite Element Models for Second Order Elliptic Problems

P. A. Raviart and J. M. Thomas **175**
9.1 Introduction 175
9.2 An abstract variational principle 176
9.3 A general approximation scheme 180
9.4 A mixed-hybrid generalization of Fraeijs de Veubeke's equilibrium method 183
9.5 A mixed-hybrid finite element method of Pian type . . . 187

10 Non-standard Finite Elements for Fourth Order Elliptic Problems

F. Brezzi **193**
10.1 Introduction 193
10.2 Presentation of the various models 194
10.3 Abstract theorems 199
10.4 Mathematical analysis of the various models 201

11 Some Equilibrium Finite Element Methods for Two-Dimensional Problems in Continuum Mechanics

C. Johnson and B. Mercier **213**
11.1 Introduction 213
11.2 A variational formulation of the elasticity problem . . . 213
11.3 Some finite element methods for the elasticity problem . 216
11.4 Applications to plasticity problems 220
11.5 Applications to fluid mechanics 221

12 Improved Displacement Finite Elements for Incompressible Materials

J. H. Argyris and P. C. Dunne **225**
12.1 Introduction 225
12.2 Partition of strain energy density $\bar{\Phi}$ 226
12.3 Calculation of the dilatational potential energy 227
12.4 Equilibrium and constraint equations for incompressible case 229
12.5 Equilibrium and constraint equations in compressible case 232
12.6 Numerical examples 232

13 On Numerical Methods for the Stokes Problem

R. Glowinski and O. Pironneau **243**
13.1 Introduction 243
13.2 The Stokes and Navier–Stokes equations 243
13.3 Review of some standard numerical methods for the Stokes problem 244
13.4 On a new method for the solution of the Stokes problem . 253
13.5 Further references and conclusion 263

14 Use of the Current Stiffness Parameter in Solution of Nonlinear Problems

P. G. Bergan, I. Holand, and T. H. Söreide **265**
14.1 Introduction 265
14.2 Current stiffness parameter 266
14.3 Use of current stiffness parameter to guide solution process 269
14.4 Numerical studies 273
14.5 Concluding remarks 281

15 Total and Updated Lagrangian Descriptions in Nonlinear Structural Analysis: A Unified Approach

S. Cescotto, F. Frey, and G. Fonder **283**
15.1 Introduction 283
15.2 Derivation of the generalized Lagrangian description . . 285
15.3 Total Lagrangian description 289
15.4 Updated Lagrangian description 290
15.5 Conclusions 293

16 Hyper-beams, Generalized Splines, and Practical Curve Fitting

B. M. Irons **297**
16.1 Introduction and motivation 297
16.2 Linear splines 297
16.3 Cubic splines 298
16.4 Quintic and higher splines 300
16.5 Misbehaviour of the cubic spline 301
16.6 The equation-solving algorithm 302
16.7 Uniqueness of the solution 304
16.8 Practical aspects, examples, and conclusion 305

17 The Saddle Point of a Differential Program

H. Matthies, G. Strang, and E. Christiansen **309**
17.1 Introduction 309
17.2 The choice of spaces 310
17.3 The minimax theorem 315
Appendix: Proof of the minimax theorem 317

18 A Finite Element Method for Cyclically Loaded Creeping Structures

A. R. S. Ponter and P. Brown **319**
18.1 Introduction 319
18.2 The rapid cycling solution 321
18.3 The finite element method 325
18.4 A plate problem 328
18.5 Conclusion 332
Appendix: Non-dimensional variables 332

19 Application of the Biorthogonal Lanczos Algorithm

M. Geradin **335**
19.1 The generalized eigenvalue problem 335
19.2 The biorthogonal Lanczos algorithm 336
19.3 Numerical scaling 338
19.4 Reorthonormalization 339
19.5 Construction of the Hermitian operator P_r 341
19.6 Calculation of eigensolutions 343
19.7 Numerical experiments 344
19.8 Conclusion 347

Appendix: The Main Publications of Professor Fraeijs de Veubeke 349
