List of symbols	vii
1 Introduction	1
1.1 Workforce scheduling applications	3
1.2 Problem description and terminology	5
2 Literature survey	9
2.1 Shift scheduling	11
2.1.1 Models	11
2.1.2 Methods	21
2.2 Days off scheduling	27
2.2.1 Models	27
2.2.2 Methods	38
3 A network-based modeling framework for workforce scheduling problems	45
3.1 Preliminaries	45
3.2 A generic network model for workforce scheduling problems	49
3.2.1 Description of the underlying network	49
3.2.2 Resource constraints on paths	54
3.2.3 Mathematical programming formulation	56
3.3 Modeling shift scheduling problems	58
3.3.1 Problem description	58
3.3.2 Construction of the underlying network	60
3.3.3 Instantiation of resource constraints	65
3.4 Modeling days off scheduling problems	70
3.4.1 Problem description	71
3.4.2 Construction of the underlying network	74
3.4.3 Instantiation of resource constraints	77

4	Solution procedures	83
4.1	Components of branch-and-price	83
4.1.1	Branch-and-bound	83
4.1.2	Column generation	92
4.1.3	Shortest path problem with resource constraints	97
4.2	Comprehensive description of branch-and-price	103
4.2.1	Branching schemes	106
4.2.2	Branching strategy	118
4.2.3	Algorithm variants	126
4.3	Comparison with similar approaches	130
5	Implementation and computational results	137
5.1	Implementation	137
5.1.1	Class Graph and dependent classes	139
5.1.2	Class labelnodelist and dependent classes	139
5.1.3	Class VarPool and dependent classes	140
5.1.4	Class BB and dependent classes	141
5.2	Testsets	142
5.2.1	Shift scheduling	142
5.2.2	Days off scheduling	146
5.3	Results	150
5.3.1	Shift scheduling	151
5.3.2	Days off scheduling	156
6	Conclusion	161
A	Computational results for shift scheduling problems	165
B	Computational results for days-off scheduling problems	179
	Bibliography	191
