

Contents

1	Introduction	1
2	Fundamentals of semiconductor devices	5
	2.1 Semiconductors	5
	2.2 Band structure of p-n junctions	8
	2.2.1 Doping of semiconductors	8
	2.2.2 p-n junction	9
	2.2.3 Double heterostructures and quantum wells	11
	2.3 Radiative recombination	14
	2.4 Modelling of the emission spectra	15
	2.5 Light extraction from a LED	18
	2.6 Non-radiative recombination	21
3	Micro electroluminescence set-up	23
	3.1 Principle of the set-up	23
	3.2 Optics	25
	3.2.1 Step size at the chip surface	26
	3.2.2 Space resolution	26
	3.3 The positioning system	27
	3.4 The Ulbricht sphere	27
4	Micro electroluminescence - results and discussion	29
	4.1 Description of the samples	29
	4.1.1 The HWFR-B 410 LED: basic properties	30
	4.2 Sample preparation	34
	4.3 Experimental details for micro electroluminescence measurement	34
	4.4 Temperature analysis	35
	4.5 Experiment	36
	4.5.1 Glue hardening	36
	4.5.2 Spectral measurements along the z-axis	37

4.6 Discussion of the results	40
4.6.1 Glue hardening	40
4.6.2 Micro electroluminescence along the z-axis	41
4.6.3 Modelling A_1 and A_2 versus z	41
4.6.4 Current dependence	45
4.6.5 Measurements along the x-axis	47
5 Aging of LEDs	49
5.1 Degradation under high forward current-chip only	49
5.2 Positive aging	49
5.3 Long-term aging	55
6 Injection molding of LED clusters	61
6.1 General set-up and temperature measurements	61
6.1.1 The module (molded part)	63
6.1.2 Optics	65
6.1.3 Temperature measurement	66
6.1.4 Temperature simulation	71
6.2 Influence of injection molding on the LED performance	74
6.2.1 Results and discussion	74
6.3 Radiation pattern of the PMMA optic	80
7 Diffusion model for LED degradation	83
7.1 The dependence of electroluminescence on trap concentration	83
7.2 Identifying magnesium as the p-type doping material	86
7.3 Magnesium diffusion into the active layer	89
7.4 Data analysis	92
7.4.1 The activation and diffusivity of magnesium in AlInGaP	95
8 Summary	99
9 Appendix	101
Bibliography	107
