Contents

Preface xi

Part I: Introduction 1

1: The Vision of Leibniz 3

2: A Brief History 11
2.1. A timeline for calculus 12
2.2. A timeline for the computer 15
2.3. An important mathematical controversy 17
2.4. Some important personalities 19

3: A Review of Calculus 25
3.1. Real numbers. Sequences of real numbers 26
3.2. Functions 29
3.3. Differential equations 38
3.4. The Fundamental Theorem of Calculus 41
3.5. A look ahead 58

4: A Short Review of Linear Algebra 61
4.1. Linear combinations, linear independency, and basis. . . . 62
4.2. Norms, inner products, and orthogonality. 63
4.3. Linear transformations and matrices 67
4.4. Eigenvalues and eigenvectors 68
4.5. Norms of matrices 70
4.6. Vector spaces of functions 71

5: Polynomial Approximation 75
5.1. Vector spaces of polynomials 75
5.2. Polynomial interpolation 78

5.3. Vector spaces of piecewise polynomials 87
5.4. Interpolation by piecewise polynomials 90
5.5. Quadrature 95
5.6. The L_2 projection into a space of polynomials 100
5.7. Approximation by trigonometric polynomials 102

6: Galerkin's Method **104**
6.1. Galerkin's method with global polynomials 105
6.2. Galerkin's method with piecewise polynomials 113
6.3. Galerkin's method with trigonometric polynomials 122
6.4. Comments on Galerkin's method 126
6.5. Important issues 127

7: Solving Linear Algebraic Systems **129**
7.1. Stationary systems of masses and springs 131
7.2. Direct methods 136
7.3. Direct methods for special systems 146
7.4. Iterative methods 151
7.5. Estimating the error of the solution 166

Part II: The archetypes **171**

8: Two-Point Boundary Value Problems **173**
8.1. The finite element method 178
8.2. Error estimates and adaptive error control 189
8.3. Data and modeling errors 197
8.4. Higher order finite element methods 199
8.5. The elastic beam 202
8.6. A comment on a priori and a posteriori analysis 204

9: Scalar Initial Value Problems **205**
9.1. A model in population dynamics 207
9.2. Galerkin finite element methods 209
9.3. A posteriori error analysis and adaptive error control . . . 217
9.4. A priori error analysis 228
9.5. Quadrature errors 234
9.6. The existence of solutions 237

10: Initial Value Problems for Systems 241
10.1. Model problems 242
10.2. The existence of solutions and Duhamel's formula 249
10.3. Solutions of autonomous problems 251
10.4. Solutions of non-autonomous problems 254
10.5. Stability 255
10.6. Galerkin finite element methods 261
10.7. Error analysis and adaptive error control 263
10.8. The motion of a satellite 271

11: Calculus of Variations 275
11.1. Minimization problems 276
11.2. Hamilton's principle 280

12: Computational Mathematical Modeling 284

Part III: Problems in several dimensions 291

13: Calculus of Several Variables 293
13.1. Functions 293
13.2. Partial derivatives 295
13.3. Integration 303
13.4. Representation by potentials 312
13.5. A model of heat conduction 313
13.6. Calculus of variations in several dimensions 317
13.7. Mechanical models 318

14: Piecewise Polynomials in Several Dimensions 320
14.1. Meshes in several dimensions 321
14.2. Vector spaces of piecewise polynomials 324
14.3. Error estimates for piecewise linear interpolation 334
14.4. Quadrature in several dimensions 339

15: The Poisson Equation 343
15.1. The finite element method for the Poisson equation 354
15.2. Energy norm error estimates 370
15.3. Adaptive error control 374
15.4. Dealing with different boundary conditions 377

15.5. Error estimates in the L_2 norm 386

16: The Heat Equation **395**
16.1. Maxwell's equations 395
16.2. The basic structure of solutions of the heat equation . . . 397
16.3. Stability 404
16.4. A finite element method for the heat equation 406
16.5. Error estimates and adaptive error control 411
16.6. Proofs of the error estimates 414

17: The Wave Equation **422**
17.1. Transport in one dimension 423
17.2. The wave equation in one dimension 426
17.3. The wave equation in higher dimensions 434
17.4. A finite element method 439
17.5. Error estimates and adaptive error control 443

18: Stationary Convection-Diffusion Problems **452**
18.1. A basic model 453
18.2. The stationary convection-diffusion problem 455
18.3. The streamline diffusion method 460
18.4. A framework for an error analysis 464
18.5. A posteriori error analysis in one dimension 468
18.6. Error analysis in two dimensions 471
18.7. 79 A.D. 474

19: Time Dependent Convection-Diffusion Problems **476**
19.1. Euler and Lagrange coordinates 478
19.2. The characteristic Galerkin method 482
19.3. The streamline diffusion method on an Euler mesh 487
19.4. Error analysis 491

20: The Eigenvalue Problem for an Elliptic Operator **497**
20.1. Computation of the smallest eigenvalue 501
20.2. On computing larger eigenvalues 502
20.3. The Schrödinger equation for the hydrogen atom 505
20.4. The special functions of mathematical physics 508

21: The Power of Abstraction **510**
21.1. The abstract formulation 511
21.2. The Lax-Milgram theorem 513
21.3. The abstract Galerkin method 515
21.4. Applications 516
21.5. A strong stability estimate for Poisson's equation 525
