

TABLE OF CONTENTS

PREFACE	xi
CHAPTER 1 Elementary properties of matrices.....	1
1. Introduction.....	1
2. Addition of vectors.....	1
3. Multiplication of a vector by a scalar.....	2
4. Linear mappings.....	3
5. Operations on matrices: addition.....	6
6. Multiplication of a matrix by a scalar.....	9
7. Product of two matrices.....	10
8. Particular matrix products.....	14
9. Basis matrices.....	15
10. Products $A \cdot E_{kl}$ and $E_{kl} \cdot A$	16
11. Numerical calculation of matrix products.....	18
12. Transposition.....	19
13. Conjugate and associate.....	21
CHAPTER 2 Vector and matrix norms.....	23
1. Elementary properties.....	23
2. Examples of vector norms.....	23
3. Matrix norms.....	26
4. Comparison of Holder norms.....	27
5. Definition of geometric norms.....	29
6. Geometric norms of matrices.....	31
7. Norms of square matrices.....	35
8. R^n as a Hilbert space.....	37
CHAPTER 3 Inversion of matrices—Theory.....	43
1. Linear independence of vectors.....	43
2. Systems of generators.....	43
3. Definition of basis.....	44
4. Fundamental theorem on the existence of a solution of a homogeneous system with more unknowns than equations.....	44
5. Dimension.....	46

6. Isomorphism of R^n or C^n with every vector space over R or C with finite dimension	48
7. Inverse of a linear transformation	48
8. Linearity of the inverse transformation	50
9. Indicator of linear independence	51
10. Properties of determinants	56
11. Existence and construction of determinants	57
12. Formulae and definitions	58
13. Necessary and sufficient conditions for the existence of the inverse matrix	59
14. Existence of the inverse in a normed space	60
15. Theoretical solution of a system of linear equations	62
CHAPTER 4 Direct methods for the solution of a system of linear equations	63
1. Systems with a diagonal matrix	63
2. Systems with a triangular matrix	63
3. Inversion of a triangular matrix	66
4. General case: Gauss' method of simple elimination	68
5. Decomposition of a matrix into the form $T \cdot A'$	72
6. An expression for the elements arising in the normal elimination process	74
7. Gauss' method: formulae for computation	76
8. Crout's method	81
9. Jordan's method of complete elimination	84
10. Orthogonalization methods: the Schmidt process	87
11. Conservation of scalar products	88
12. Schmidt's algorithm	89
13. Solution of a system of equations by row orthogonalization	94
14. Method of rotations	97
15. Rotation algorithm	98
16. General direct methods for the inverse of a matrix	99
17. Evaluation of a determinant	104
18. Systems with a symmetric matrix	105
19. Jordan's method	106
20. Choleski's method	106
21. Use of partitioned matrices	112
22. Extension method	113
Problems on Chapters 1-4	115
CHAPTER 5 Indirect methods	119
1. Introduction	119
2. Iteration and relaxation	119
3. Relaxation	121
4. Southwell's method	125
5. Convergence of Southwell's method	127
6. The Gauss-Seidel method	131
7. The successive over-relaxation method	134
8. Linear iterative methods	138
9. Convergence of linear iterative methods	141
10. Application to the classical iterative methods	145

11. Sufficient conditions derived from Hadamard's theorem.....	146
12. Frobenius–Mises theorem.....	147
13. Successive over-relaxation for Hermitian (or real symmetric) matrices.....	149
14. Other theorems on the location of eigenvalues.....	151
15. Projection methods.....	152
16. Decomposition of a norm.....	153
17. Projection on a plane perpendicular to $A^T z_r$	155
18. Projection on the plane corresponding to the largest residual.....	156
19. Kacmarz's method.....	157
20. Projections corresponding to decompositions of the norm ϕ_1	159
21. Process corresponding to the decomposition of the norm ϕ_2	160
22. Cimmino's process.....	160
23. Iterative methods for systems with a symmetric matrix.....	162
24. The gradient method.....	169
25. Stiefel–Hestenes conjugate gradient method.....	170
26. Note on non-symmetric systems.....	174
27. Note on convergence and its improvement.....	175
28. Iterative methods for the inversion of a matrix (Hotelling–Bodewig).....	176
Problems on Chapter 5.....	180
CHAPTER 6 Invariant subspaces.....	183
1. Introduction.....	183
2. Invariant subspaces.....	185
3. Polynomial transformations.....	186
4. Invariant subspaces and polynomial transformations.....	188
5. Diagonal form.....	195
6. Characteristic polynomial.....	197
7. Elementary divisors of a polynomial matrix.....	199
8. Normal forms.....	204
9. Functions of a linear transformation.....	215
CHAPTER 7 Some applications of the properties of invariant subspaces.....	227
1. Schur's theorem.....	227
2. Polar decomposition.....	231
3. Matrices with non-negative elements.....	234
4. Graph theory and matrices with positive elements.....	244
5. Comparison of the classical iterative methods.....	250
6. Young and Frankel's theory of successive over-relaxation.....	254
7. Polynomial iteration and the Peaceman–Rachford method.....	261
8. Approximation of the spectral radius of a matrix by a norm.....	265
CHAPTER 8 Numerical methods for the calculation of eigenvalues and eigenvectors.....	271
1. Direct calculation of $\text{Det}(A - \lambda I) = F(\lambda)$	271
2. Direct use of the Cayley–Hamilton theorem.....	272
3. Leverrier's method.....	274
4. Souriau's method.....	277
5. Samuelson's method.....	278

6. Partitioning methods	281
7. Transformation methods: non-symmetric matrices	282
8. Reduction to Frobenius form	283
9. First transformation	285
10. General transformation	287
11. Transformation to triple-diagonal form	294
12. Lanczos' method	298
13. Symmetric matrices: Given's method for real matrices	306
14. Characteristic polynomial of a symmetric tridiagonal matrix	309
15. Iterative methods for eigenvalues and eigenvectors—non-symmetric matrices	314
16. Deflation	318
17. Jacobi's method for Hermitian or symmetric matrices	321
18. Rutishauser's LR method	328
Problems on Chapters 6, 7 and 8	336
Short Bibliography	341
