Preface	xi
1 General Introduction	1
1.1 The microcomputer style of programming	1
1.2 Modules and subroutines	2
1.3 Notation and conventions of this book	4
1.4 The program presentation format	6
1.5 Brief survey of chapter contents	7
2 Root-finding Methods and their Application	9
2.1 General introduction	9
2.2 The root-finding approach	9
2.3 Root-finding modules	11
2.4 A note on cubic equations	14
2.5 Brief program descriptions and programs	15
ROOTSCAN, NEWTON, SECANT, ZIGZAG.	15
2.6 Extrema and roots	18
2.7 The programs SEARCH and MAXMIN	20
2.8 Expectation values. The integral approach	21
2.9 The energy approach	22
2.10 Calculating local quantities	23
3 The Richardson Extrapolation Method	25
3.1 General introduction	25
3.2–3.9 Microcomputer calculus. An example. Numerical differentiation. General applications. Richardson versus Padé. The residual error term. The standard extrapolation formulae. The non-standard case. The general case. The program RICH.	25
ROMBERG. Mathematical theory	35
3.10–3.14 Midpoint integration. Finding the A_N . A modified midpoint rule. Relative merits of quadrature rules. Three-point rules.	35

	ROMBERG. Programming notes	40
3.15–3.17	The subroutine structure. The two-point methods. Three-point rules.	40
3.18	ROMBERG. Program analysis and program	41
	ROMBERG. Specimen results	44
3.19–3.22	The error integral. End-point singularities. Residual error examples. Final comments.	44
4	Some Interpolation and Extrapolation Methods	50
4.1	General introduction	50
	INTERP. Mathematical theory	50
4.2–4.4	The Lagrange interpolation procedure. The divided difference approach. Computing derivatives.	50
	INTERP. Programming notes	53
4.5–4.7	ARRAYS. Variable indices. Derivatives	53
4.8	INTERP. Program analysis and program	54
	INTERP. Specimen results	55
4.9–4.10	Runge's example. Final comments.	55
	SPLINE and SPLEEN. Mathematical theory	57
4.11–4.13	Quadratic splines. The fundamental equations. The collocation method. SPLEEN.	57
4.14	SPLINE. Program analysis and program	61
	SPLINE. Specimen results	62
4.15	Energy level interpolation	62
4.16	SPLEEN. Program analysis and program	63
	SPLEEN. Specimen results	65
4.17	Energy level calculations	65
	WYNN. Mathematical theory	66
4.18–4.22	The Aitken transformation. Multi-component sequences. Padé approximants. Series of Stieltjes. The algorithm.	66
	WYNN. Programming notes	73
4.23–4.27	Setting array dimensions. Use as a library subroutine. Labelling the approximants. Storing and displaying the (M/N) . Rounding errors and scaling tests.	73
4.28	WYNN. Program analysis and program	76
	WYNN. Specimen results	78
4.29–4.31	Varying KS. Perturbation series analysis. Comments on the results.	78
5	The Matrix Inverse and Generalized Inverse	81
5.1	General introduction	81
	MATIN and GENFIT. Mathematical theory	81
5.2–5.5	Choice of reduction method. Least-squares fitting. The generalized inverse. An example. Parabolic fitting. An iterative method.	81

	MATIN and GENFIT. Programming notes	84
5.6–5.7	Program module structure. Forming $M^T M$ for GENFIT.	84
5.8	MATIN. Program analysis and program	86
5.9	GENFIT. Program analysis and program	89
	GENFIT. Specimen results	93
5.10	A parallel test	93
5.11	INVERT. Program analysis and program	95
6	The Matrix Eigenvalue Problem	99
6.1	General introduction	99
	JOLLY. Mathematical theory	99
6.2–6.9	The origin of JOLLY. Some simple transformations. The algorithm. The eigencolumns. Eigenvalues by deflation. Rapid eigenvalue calculation. Non-symmetric matrices. Preliminary transformations.	99
	JOLLY. Programming notes	106
6.10–6.13	The form of $R(N, K)$. The matrix indices. The working copy, including λ . The subroutine structure.	106
6.14	JOLLY. Program analysis and program	107
	JOLLY. Specimen results	110
6.15–6.17	A 5×5 example. Matrices with equal diagonal elements. Using Aitken extrapolation.	110
	FOLDER. Mathematical theory	112
6.18–6.23	Introduction. The perturbation approach. An explicit example. An alternative approach. Calculating eigenvectors. Solving linear equations.	112
	FOLDER. Programming notes	119
6.24–6.27	Array requirements. The modular structure. Index permutation. The use of submatrices.	119
6.28	FOLDER. Program analysis and program	120
	FOLDER. Specimen results	124
6.29–6.33	Simple test example. A complex matrix example. Finding double roots. An iterative method. Band matrices.	124
	HITTER. Mathematical theory	128
6.34–6.39	The self-consistency problem. The Brillouin–Wigner method. The direct iteration procedure. Relaxation parameters and Rayleigh quotients. The matrix H . Algebraic matrix elements.	124
	HITTER. Programming notes	134
6.40–6.42	The relaxation parameter. Displaying the eigencolumn. The λ parameter.	134
6.43	HITTER. Program analysis and program	135
	HITTER. Specimen results	137
6.44	Eigenvalues for BETOSC	137
6.45	BETOSC. Program analysis and program	138
6.46	Using FOLDER with BETOSC	140

7	Two Perturbation Methods	142
	7.1 General introduction	142
	HYPOSC. Mathematical theory	142
	7.2–7.3 Hypervirial theorems. The perturbation recurrence relation.	142
	HYPOSC. Programming notes	145
	7.4–7.10 Use of the value $\lambda = 1$. Use of the F factor. Calculation of array indices. Calculation of $\langle x^N \rangle$. The calculation of WKB results. Variable α and β . The T array and the Wynn algorithm.	145
	7.11 HYPOSC. Program analysis and program	147
	HYPOSC. Specimen results	150
	7.12–7.13 Perturbed oscillator energies. Recent developments.	150
	RALLY. Mathematical theory	152
	7.14–7.15 Convergence criteria. The recurrence relations.	152
	RALLY. Programming notes	154
	7.16–7.17 The array problem. Use of $\lambda = 1$.	154
	7.18 RALLY. Program analysis and program	155
	RALLY. Specimen results	158
	7.19–7.21 Rayleigh–Schrödinger mode. Brillouin–Wigner mode. Rayleigh iteration mode.	158
8	Finite Difference Eigenvalue Calculations	160
	8.1 General introduction	160
	RADIAL. Mathematical theory	160
	8.2–8.4 The finite difference approximation. The shooting approach. Expectation values.	160
	RADIAL. Programming notes	164
	8.5–8.9 Initial conditions. Storage requirements. Node counting. The choice of L . The index I .	164
	8.10 RADIAL. Program analysis and program	166
	RADIAL. Specimen results	169
	8.11–8.12 The Coulomb potential. A comment on singular potentials.	169
	FIDIF. Mathematical theory	171
	8.13–8.20 The three-term recurrence relation. Obtaining h^4 error. Initial and boundary conditions. Forwards and backwards shooting. The Numerov method. The three methods of FIDIF. The propagator approach. Excited state calculations.	171
	FIDIF. Programming notes	177
	8.21–8.24 The range of x . An economical starting procedure. The boundary conditions. Wavefunction scaling.	177
	8.25 FIDIF. Program analysis and program	180
	FIDIF. Specimen results	183
	8.26–8.29 Comparison of methods 2 and 3. Extrapolation for method 1. Expectation values. Final comments.	183

9	Recurrence Relation Methods	187
9.1	General introduction	187
	SERAT and SEROSC. Mathematical theory	187
9.2–9.7	The perturbed Coulomb potential. The recurrence relation. The zero-coefficient test. Forwards nested multiplication. The perturbed oscillator potential. The ‘false eigenvalue’ effect.	187
	SERAT and SEROSC. Programming notes	193
9.8–9.11	Array dimensions. Modular structure. Precomputation. Reduction in strength. The scaling factor.	193
9.12	SERAT. Program analysis and program	194
	SERAT and SEROSC. Specimen results	199
9.13–9.15	Published applications for SERAT. Some specimen results for SEROSC. The CT parameter.	199
	MOMOSC. Mathematical theory	201
9.16–9.20	Inner product recurrence relations. The computational procedure. A link with matrix theory. The angular momentum variable. A perturbation approach.	201
	MOMOSC. Programming notes	205
9.21	The singularity problem	205
9.22	MOMOSC. Program analysis and program	205
	MOMOSC. Specimen results	208
9.23–9.24	Comparison with SEROSC. Some specimen expectation values.	208
10	Two Research Problems	210
10.1	General introduction	210
	TWODOSC. Mathematical theory	210
10.2	The recurrence relations	210
	TWODOSC. Programming notes	212
10.3–10.4	Array requirements. Exploiting the symmetry.	212
10.5	TWODOSC. Programming analysis and program	213
	TWODOSC. Specimen results	215
10.6	Results at small λ	215
	ZEEMAN. Mathematical theory	216
10.7–10.9	Introduction. Implicit basis methods. Using explicit basis functions.	216
	ZEEMAN. Programming notes	220
10.10–10.11	Array requirements. Subroutine structure.	220
10.12	ZEEMAN. Program analysis and program	221
	ZEEMAN. Specimen results	224
10.13	Shooting–relaxation mode	224
	Bibliography	225
	Index	231
