

# Table of Contents

<b>1</b>	<b>Getting Started</b> .....	1
1.1	The First Diffpack Encounter .....	2
1.1.1	What is Diffpack? .....	2
1.1.2	A Trivial C++ Program .....	4
1.1.3	A Trivial Diffpack Program .....	5
1.2	Steady 1D Heat Conduction .....	6
1.2.1	The Physical and Mathematical Model .....	7
1.2.2	A Finite Difference Method .....	9
1.2.3	Implementation in Diffpack .....	12
1.2.4	Dissection of the Program .....	15
1.2.5	Tridiagonal Matrices .....	16
1.2.6	Variable Coefficients .....	17
1.2.7	A Nonlinear Heat Conduction Problem .....	18
1.3	Simulation of Waves .....	23
1.3.1	Modeling Vibrations of a String .....	23
1.3.2	A Finite Difference Method .....	26
1.3.3	Implementation .....	27
1.3.4	Visualizing the Results .....	30
1.3.5	A 2D Wave Equation with Variable Wave Velocity .....	37
1.3.6	A Model for Water Waves .....	39
1.4	Projects .....	47
1.4.1	A Uni-Directional Wave Equation .....	47
1.4.2	Centered Differences for a Boundary-Layer Problem .....	47
1.4.3	Upwind Differences for a Boundary-Layer Problem .....	49
1.5	About Programming with Objects .....	50
1.5.1	Motivation for the Object Concept .....	52
1.5.2	Example: Implementation of a Vector Class in C++ .....	57
1.5.3	Arrays in Diffpack .....	65
1.5.4	Example: Design of an ODE Solver Environment .....	72
1.5.5	Abstractions for Grids and Fields .....	81
1.6	Coding the PDE Simulator as a Class .....	85
1.6.1	Steady 1D Heat Conduction Revisited .....	85
1.6.2	Empirical Investigation of the Numerical Method .....	92
1.6.3	Simulation of Waves Revisited .....	95
1.7	Projects .....	102
1.7.1	Transient Flow Between Moving Plates .....	102
1.7.2	Transient Channel Flow .....	104
1.7.3	Coupled Heat and Fluid Flow .....	105
1.7.4	Difference Schemes for Transport Equations .....	107

<b>2</b>	<b>Introduction to Finite Element Discretization</b> . . . . .	109
2.1	Weighted Residual Methods . . . . .	110
2.1.1	Basic Principles . . . . .	110
2.1.2	Example: A 1D Poisson Equation . . . . .	112
2.1.3	Treatment of Boundary Conditions . . . . .	116
2.2	Time Dependent Problems . . . . .	120
2.2.1	A Wave Equation . . . . .	121
2.2.2	A Heat Equation . . . . .	123
2.3	Finite Elements in One Space Dimension . . . . .	125
2.3.1	Piecewise Polynomials . . . . .	125
2.3.2	Handling of Essential Boundary Conditions . . . . .	128
2.3.3	Direct Computation of the Linear System . . . . .	129
2.3.4	Element-By-Element Formulation . . . . .	131
2.3.5	Extending the Concepts to Quadratic Elements . . . . .	138
2.3.6	Summary of the Elementwise Algorithm . . . . .	139
2.4	Example: A 1D Wave Equation . . . . .	141
2.4.1	The Finite Element Equations . . . . .	141
2.4.2	Interpretation of the Discrete Equations . . . . .	142
2.4.3	Accuracy and Stability . . . . .	144
2.5	Naive Implementation . . . . .	148
2.6	Projects . . . . .	154
2.6.1	Heat Conduction with Cooling Law . . . . .	154
2.6.2	Retardation of a Well-Bore . . . . .	155
2.7	Higher-Dimensional Finite Elements . . . . .	157
2.7.1	The Bilinear Element and Generalizations . . . . .	158
2.7.2	The Linear Triangle . . . . .	161
2.7.3	Example: A 2D Wave Equation . . . . .	163
2.7.4	Other Two-Dimensional Element Types . . . . .	166
2.7.5	Three-Dimensional Elements . . . . .	168
2.8	Calculation of derivatives . . . . .	169
2.8.1	Global Least-Squares Smoothing . . . . .	169
2.8.2	Flux Computations in Heterogeneous Media . . . . .	170
2.9	Convection-Diffusion Equations . . . . .	175
2.9.1	A One-Dimensional Model Problem . . . . .	176
2.9.2	Multi-Dimensional Equations . . . . .	179
2.9.3	Time-Dependent Problems . . . . .	180
2.10	Analysis of the Finite Element Method . . . . .	183
2.10.1	Weak Formulations . . . . .	184
2.10.2	Variational Problems . . . . .	186
2.10.3	Results for Continuous Problems . . . . .	189
2.10.4	Results for Discrete Problems . . . . .	195
2.10.5	A Priori Error Estimates . . . . .	200
2.10.6	Numerical Experiments . . . . .	203
2.10.7	Adaptive Finite Element Methods . . . . .	205

<b>3</b>	<b>Programming of Finite Element Solvers</b>	213
3.1	A Simple Program for the Poisson Equation	213
3.1.1	Discretization	214
3.1.2	Basic Parts of a Simulator Class	215
3.2	Increasing the Flexibility	223
3.2.1	A Generalized Model Problem	223
3.2.2	Using the Menu System	224
3.2.3	Creating the Grid Object	228
3.3	Some Visualization Tools	230
3.3.1	Storing Fields for Later Visualization	230
3.3.2	Filtering Simres Data	230
3.3.3	Visualizing Diffpack Data in Plotmtv	232
3.3.4	Visualizing Diffpack Data in Matlab	237
3.3.5	Visualizing Diffpack Data in Vtk	238
3.3.6	Visualizing Diffpack Data in IRIS Explorer	239
3.3.7	Plotting Fields Along Lines Through the Domain	240
3.4	Some Useful Diffpack Features	241
3.4.1	The Menu System	241
3.4.2	Multiple Loops	244
3.4.3	Computing Numerical Errors	245
3.4.4	Functors	246
3.4.5	Computing Derivatives of Finite Element Fields	248
3.4.6	Specializing Code in Subclass Solvers	252
3.5	Introducing More Flexibility	254
3.5.1	Setting Boundary Condition Information in the Grid	255
3.5.2	Line and Surface Integrals	260
3.5.3	Simple Mesh Generation Tools	263
3.5.4	Debugging	269
3.5.5	Automatic Report Generation	272
3.5.6	Specializing Code in Subclass Solvers	274
3.5.7	Overriding Menu Answers in the Program	279
3.5.8	Estimating Convergence Rates	281
3.5.9	Axisymmetric Formulations and Cartesian 2D Code	284
3.5.10	Summary	285
3.6	Adaptive Grids	287
3.6.1	How to Extend an Existing Simulator	287
3.6.2	Organization of Refinement Criteria	289
3.6.3	Example: Corner-Flow Singularity	292
3.6.4	Transient Problems	292
3.7	Projects	295
3.7.1	Flow in an Open Inclined Channel	295
3.7.2	Stress Concentration due to Geometric Imperfections	297
3.7.3	Lifting Airfoil	298
3.8	A Convection-Diffusion Solver	300
3.9	A Heat Equation Solver	302

3.9.1	Discretization .....	304
3.9.2	Implementation.....	305
3.10	A More Flexible Heat Equation Solver .....	311
3.10.1	About the Model Problem and the Simulator.....	311
3.10.2	Visualization and Animation of Time-Dependent Data..	313
3.10.3	Variable Time Step Size .....	317
3.10.4	Applying a Transient Solver to a Stationary PDE.....	318
3.10.5	Handling Simulation and Visualization from a Script ...	319
3.10.6	Some Computer Exercises Involving Heat Transfer .....	321
3.11	Efficient Solution of the Wave Equation .....	324
3.11.1	Discretization .....	324
3.11.2	Implementation.....	325
3.11.3	Extensions of the Model Problem .....	329
3.11.4	Flexible Representation of Variable Coefficients .....	330
<b>4</b>	<b>Nonlinear Problems .....</b>	<b>335</b>
4.1	Discretization and Solution of Nonlinear PDEs .....	335
4.1.1	Finite Difference Discretization .....	335
4.1.2	Finite Element Discretization .....	336
4.1.3	The Group Finite Element Method .....	338
4.1.4	Successive Substitutions .....	340
4.1.5	Newton-Raphson's Method.....	340
4.1.6	A Transient Nonlinear Heat Conduction Problem .....	345
4.1.7	Iteration Methods at the PDE Level .....	348
4.1.8	Continuation Methods.....	351
4.2	Software Tools for Nonlinear Finite Element Problems .....	352
4.2.1	A Solver for a Nonlinear Heat Equation .....	352
4.2.2	Extending the Solver .....	358
4.3	Projects.....	361
4.3.1	Operator Splitting for a <u>Reaction-Diffusion Model</u> .....	361
4.3.2	Compressible Potential Flow .....	363
<b>5</b>	<b>Solid Mechanics Applications .....</b>	<b>367</b>
5.1	Linear Thermo-Elasticity .....	368
5.1.1	Physical and Mathematical Problem .....	368
5.1.2	A Finite Element Method.....	370
5.1.3	Engineering Finite Element Notation.....	373
5.1.4	Implementation.....	376
5.1.5	Examples .....	383
5.2	Elasto-Viscoplasticity .....	387
5.2.1	Basic Physical Features of Elasto-Viscoplasticity .....	387
5.2.2	A Three-Dimensional Elasto-Viscoplastic Model .....	390
5.2.3	Simplification in Case of a Forward Scheme in Time ...	394
5.2.4	Numerical Handling of Yield Criteria.....	395
5.2.5	Implementation.....	398

<b>6</b>	<b>Fluid Mechanics Applications</b>	403
6.1	Convection-Diffusion Equations	403
6.1.1	The Physical and Mathematical Model	403
6.1.2	A Finite Element Method	405
6.1.3	Incorporation of Nonlinearities	405
6.1.4	Software Tools	406
6.1.5	Melting and Solidification	408
6.2	Shallow Water Equations	410
6.2.1	The Physical and Mathematical Model	411
6.2.2	Finite Difference Methods on Staggered Grids	412
6.2.3	Implementation	416
6.2.4	Nonlinear and Dispersive Terms	420
6.2.5	Finite Element Methods	422
6.3	An Implicit Finite Element Navier-Stokes Solver	426
6.3.1	The Physical and Mathematical Model	426
6.3.2	A Finite Element Method	427
6.3.3	Solution of the Nonlinear Systems	429
6.3.4	Implementation	431
6.4	A Classical Finite Difference Navier-Stokes Solver	439
6.4.1	Operator Splitting	439
6.4.2	Finite Differences on 3D Staggered Grids	441
6.4.3	A Multigrid Solver for the Pressure Equation	445
6.4.4	Implementation	445
6.5	A Fast Finite Element Navier-Stokes Solver	448
6.5.1	Operator Splitting and Finite Element Discretization	449
6.5.2	An Optimized Implementation	451
6.6	Projects	454
6.6.1	Analysis of Discrete Shallow Water Waves	454
6.6.2	Approximating the Navier-Stokes Equations by a Laplace Equation	455
<b>7</b>	<b>Coupled Problems</b>	457
7.1	Fluid-Structure Interaction; Squeeze-Film Damping	457
7.1.1	The Physical and Mathematical Model	457
7.1.2	Numerical Methods	463
7.1.3	Implementation	465
7.2	Fluid Flow and Heat Conduction in Pipes	472
7.2.1	The Physical and Mathematical Model	472
7.2.2	Numerical Methods	476
7.2.3	Implementation	480
7.3	Projects	487
7.3.1	Transient Thermo-Elasticity	487
7.3.2	Convective-Diffusive Transport in Viscous Flow	489
7.3.3	Chemically Reacting Fluid	489

<b>A</b>	<b>Mathematical Topics</b> .....	491
A.1	Scaling and Dimensionless Variables .....	491
A.2	Indicial Notation .....	498
A.3	Compact Notation for Difference Equations .....	500
A.4	Stability and Accuracy of Difference Approximations .....	502
A.4.1	Typical Solutions of Simple Prototype PDEs .....	503
A.4.2	Physical Significance of Parameters in the Solution .....	505
A.4.3	Analytical Dispersion Relations .....	507
A.4.4	Solution of Discrete Equations .....	510
A.4.5	Numerical Dispersion Relations .....	512
A.4.6	Convergence .....	514
A.4.7	Stability .....	515
A.4.8	Accuracy .....	516
A.4.9	Truncation Error .....	519
A.4.10	Traditional von Neumann Stability Analysis .....	521
A.4.11	Example: Analysis of the Heat Equation .....	522
A.5	Exploring the Nature of Some PDEs .....	525
<b>B</b>	<b>Diffpack Topics</b> .....	535
B.1	Brief Overview of Important Diffpack Classes .....	535
B.2	Diffpack-Related Operating System Interaction .....	540
B.2.1	Unix .....	540
B.2.2	Windows .....	542
B.3	Basic Diffpack Features .....	548
B.3.1	Diffpack man pages .....	548
B.3.2	Standard Command-Line Options .....	549
B.3.3	Generalized Input and Output .....	551
B.3.4	Automatic Verification of a Code .....	555
B.4	Visualization Support .....	556
B.4.1	Curves .....	557
B.4.2	Scalar and Vector Fields .....	561
B.5	Details on Finite Element Programming .....	564
B.5.1	Basic Functions for Finite Element Assembly .....	564
B.5.2	Using Functors for the Integrand .....	567
B.5.3	Class Relations in the Finite Element Engine .....	568
B.6	Optimizing Diffpack Codes .....	569
B.6.1	Avoiding Repeated Matrix Factorizations .....	571
B.6.2	Avoiding Repeated Assembly of Linear Systems .....	574
B.6.3	Optimizing the Assembly Process .....	583
B.6.4	Optimizing Array Indexing .....	588

<b>C Iterative Methods for Sparse Linear Systems</b> . . . . .	591
C.1 Classical Iterative Methods . . . . .	592
C.1.1 A General Framework . . . . .	593
C.1.2 Jacobi, Gauss-Seidel, SOR, and SSOR Iteration . . . . .	594
C.2 Conjugate Gradient-Like Iterative Methods . . . . .	600
C.2.1 Galerkin and Least-Squares Methods . . . . .	601
C.2.2 Summary of the Algorithms . . . . .	604
C.2.3 A Framework Based on the Error . . . . .	606
C.3 Preconditioning . . . . .	608
C.3.1 Motivation and Basic Principles . . . . .	608
C.3.2 Classical Iterative Methods as Preconditioners . . . . .	610
C.3.3 Incomplete Factorization Preconditioners . . . . .	611
C.4 Multigrid and Domain Decomposition Methods. . . . .	612
C.4.1 Domain Decomposition . . . . .	613
C.4.2 Multigrid Methods . . . . .	614
<b>D Software Tools for Solving Linear Systems</b> . . . . .	621
D.1 Storing and Initializing Linear Systems. . . . .	621
D.1.1 Vector and Matrix Formats . . . . .	622
D.1.2 Detailed Matrix Examples . . . . .	628
D.1.3 Representation of Linear Systems . . . . .	634
D.2 Programming with Linear Solvers . . . . .	637
D.2.1 Gaussian Elimination . . . . .	637
D.2.2 A Simple Demo Program . . . . .	638
D.2.3 A 3D Poisson Equation Solver . . . . .	640
D.3 Classical Iterative Methods . . . . .	644
D.4 Conjugate Gradient-like Methods . . . . .	645
D.4.1 Symmetric Systems . . . . .	645
D.4.2 Nonsymmetric Systems . . . . .	646
D.5 Preconditioning Strategies . . . . .	647
D.6 Convergence History and Stopping Criteria . . . . .	651
D.7 Example: Implicit Methods for Transient Diffusion. . . . .	661
<b>Bibliography</b> . . . . .	663
<b>Index</b> . . . . .	671
