Preface		xv
<b>1 Introduction</b>		<b>1</b>
1.1 The Schwarz–Christoffel idea		1
1.2 History		4
<b>2 Essentials of Schwarz–Christoffel mapping</b>		<b>9</b>
2.1 Polygons		9
2.2 The Schwarz–Christoffel formula		10
2.3 Polygons with one or two vertices		12
2.4 Triangles		16
2.5 Rectangles and elliptic functions		18
2.6 Crowding		20
<b>3 Numerical methods</b>		<b>23</b>
3.1 Side-length parameter problem		23
3.2 Quadrature		27
3.3 Inverting the map		29
3.4 Cross-ratio parameter problem		30
3.5 Mapping using cross-ratios		36
3.6 Software		39
<b>4 Variations</b>		<b>41</b>
4.1 Mapping from the disk		42
4.2 Mapping from a strip		44
4.3 Mapping from a rectangle		47
4.4 Exterior maps		51

4.5	Periodic regions and fractals	55
4.6	Reflections and other transformations	57
4.7	Riemann surfaces	58
4.8	Gearlike regions	60
4.9	Doubly connected regions	64
4.10	Circular-arc polygons	70
4.11	Curved boundaries	73
<b>5</b>	<b>Applications</b>	<b>75</b>
5.1	Why use Schwarz–Christoffel maps?	75
5.2	Piecewise-constant boundary conditions	77
5.3	Alternating Dirichlet and Neumann conditions	83
5.4	Oblique derivative boundary conditions	87
5.5	Generalized parameter problems	99
5.6	Free-streamline flows	101
5.7	Mesh generation	105
5.8	Polynomial approximation and matrix iterations	108
5.9	Symmetric multiply connected domains	111
	Appendix: Using the SC Toolbox	115
	Bibliography	121
	Index	131
