

CONTENTS

Preface	xi
-------------------	----

CHAPTER I

Preliminary Considerations

1.1. Maxima and minima	1
1.2. Constrained and unconstrained problems	1
1.3. Linear and nonlinear problems	4
1.4. Notes on historical development.	5
1.5. Some application problems	6
References	8

CHAPTER 2

Direct Search Methods

2.1. Introduction	9
2.2. Minimizing a function along a line	10
2.3. Quadratic interpolation for minimizing a function of a single variable	17
2.4. The method of Hooke and Jeeves	21
2.5. The method of Rosenbrock	23
2.6. The Simplex method	24
References	27

CHAPTER 3**Descent Methods**

3.1. Introduction	29
3.2. Descent methods	29
3.3. Relaxation	33
3.4. The method of steepest descent	34
3.5. Conjugate directions for minimizing a quadratic form	38
3.6. Conjugate directions for the general optimization problem	41
3.7. The method of Davidon, Fletcher, and Powell	45
3.8. Powell's method without derivatives	48
References	54

CHAPTER 4**Least Squares Problems**

4.1. Introduction	56
4.2. The linear least squares problem	56
4.3. The normal equations	57
4.4. The Choleski decomposition of a positive-definite matrix	57
4.5. Factorization by elementary orthogonal matrices	59
4.6. These factorizations compared	60
4.7. An algorithm for regression analysis	62
4.8. Newton's method for systems of nonlinear equations	65
4.9. The secant algorithm	68
4.10. The Gauss algorithm for over-determined systems	71
4.11. The approach of Levenberg, Marquardt, and Morrison	74
4.12. A method that does not use derivatives.	78
References	80

CHAPTER 5**Constrained Problems**

5.1. Introduction	82
5.2. Transformation of the independent variables	82
5.3. Transformation by the unit step function	83
5.4. Carroll's created response surface technique	84
5.5. Convex problem I	89

5.6. Convex problem II	92
5.7. Dual problems	93
5.8. SUMT without perturbation parameter	94
5.9. Selection of feasible point and perturbation parameter	98
References	101

CHAPTER 6

Numerical Results

6.1. Introduction	103
6.2. The sample problems	103
6.3. Scaling and related problems.	106
6.4. Minimizing a function on a line	108
6.5. Direct search methods	110
6.6. Descent methods	119
6.7. Minimizing a sum of squares	127
6.8. Applications of the SUMT transformation	128
References	133
Appendix 1. Summary of matrix formulas and notation	135
Appendix 2. Some results and definitions concerning convexity	138
Notes on Recent Developments	142
Author Index	145
Subject Index	147
