Preface	v
Chapter 1. What is Mathematical Programming?	
1.1 Introduction	1
1.2 Mathematical Formulation of Optimization or Programming Problems	2
Chapter 2. Equivalent Linear Programming Problems and The Simplex Method	
2.1 Statement of the Linear Programming Problem	8
2.2 Equivalent Forms of Linear Programs	9
2.3 The Simplex Method Explained by an Example	11
2.4 Some Terminology and Concepts	13
Exercises	15
2.5 Representation of Linear Programming Problems in the Form of Tableaux and the Pivotal Transformation Rules	16
2.6 Statement of the Simplex Algorithm	18
Exercise	19
2.7 Extended Tableau and Tucker–Beale Form	19
Exercises	21
Chapter 3. Some Ancillary Features of the Simplex Method	
3.1 Method of Obtaining a feasible Solution to a Linear Program	23
3.2 Phase 1 and Phase 2 of the Simplex Method: An Example	25
3.3 Some Practical Considerations for the Phase 1 Computation	27
3.4 Redundancy and Inconsistency in the Constraint Equations: Degenerate Solutions to Constraint sets	28
Exercises	34
Chapter 4. The Revised Simplex Method	
4.1 Why Revised Simplex?	35
4.2 Theory of the Method and the Algorithmic Steps	36
4.3 An Example Illustrating the Steps of the Revised Simplex Method	41
4.4 The Product Form of the Inverse	49
Exercises	55
Chapter 5. Computational Refinements and Extensions Within the Context of the Revised Simplex Method	
5.1 Computer Implementation of the Product Form of Inverse: Some Related Topics	56
5.2 Composite Simplex Algorithm and the Phase 1 Convergence	57
5.3 Simple Upper Bound Algorithm	62
5.4 Generalized Upper Bounds	64
5.5 The Elimination Form of the Inverse and the Advantage of its use	66
Exercises	68

Chapter 6. Duality Properties of Linear Programs and Post Optimal Analysis	
6.1 Duality of Mathematical Systems and the Symmetry Property of the Transformation Rules	69
6.2 Duality of the Canonical Form of Linear Program	70
6.3 Duality of the other Forms of Linear Programs	73
6.4 The Dual Simplex Algorithm	75
6.5 An Example Illustrating the Duality Properties	76
6.6 Economic Interpretation of Duality	79
6.7 Post Optimal Analysis: Ranging and Parametric Procedures	80
Exercises	83
Chapter 7. Integer and Mixed Integer Linear Programs	
7.1 Statement and Classification of Problems	85
7.2 Classification of Algorithms	87
7.3 Dual Cutting Plane Method or the Method of Integer Forms	87
7.4 An Example Illustrating the Method of Integer Forms	91
7.5 Branch and Bound Method	94
7.6 An Example Illustrating the Branch and Bound Method	97
Exercises	101
Chapter 8. Formulating Mathematical Programming Models: Linear Programming, Integer Programming and Nonlinear Programming by Extending Linear Programming Techniques	
8.1 The Components of a Mathematical Programming Model	102
8.2 Multiplant Multiproduct Production-cum-Distribution Model	104
8.3 The Fixed Charge Problem	108
8.4 The Capital Budgeting Problem	109
8.5 Integer Programming Formulation of Nonlinear Functions of One Variable	109
8.6 Piecewise Linear Representation of Nonlinear Function by Slope and Intercept	111
8.7 Separable Programming and Special Ordered Sets of Type 1 and Type 2	113
8.8 Solution of Chance Constrained Programming Problems by the Use of Separable Programming	115
Exercises	117
Chapter 9. The General Mathematical Programming Problem: Lagrange and Kuhn-Tucker Multipliers	
9.1 Generalized Mathematical Programs	121
9.2 Lagrange Multipliers for Optimization Problems with Equality Constraints	122
9.3 Interpretation of the Lagrange Multiplier	124
9.4 Kuhn-Tucker Multipliers for Problems with Inequality Constraints	125
9.5 An Example Illustrating the Use of Lagrange and Kuhn-Tucker Multipliers	128
Exercises	130
Chapter 10. Convex Quadratic Programming: Its Application and Its Solution by the Use of Kuhn-Tucker Theory	
10.1 Applications of Quadratic Programming	131
10.2 Statement of the Quadratic Programming Problem	131
10.3 Representation of the Problem and its Optimality Conditions	132

10.4	An Algorithm for Solving Quadratic Programming Problem	134
10.5	A Worked Example	135
10.6	Positive Definiteness of Quadratic Forms	137
	Exercises	139
Chapter 11. Linear Programming, Quadratic Programming, Theory of Games, and the Fundamental Problem: Algebra and Combinatorics of Pivot Theory for such Problems		
11.1	An Approach to Unify the Programming and Games Problems and Their Solutions	140
11.2	Matrix Games, Their Applications, Theory and some Terminology	141
11.3	Transforming a Matrix Game to Linear Program and Vice Versa	147
11.4	Matrix Games and Linear Programs: An Example	151
11.5	Statement of Linear Program, Quadratic Program, and the Matrix Game as a Fundamental Problem	156
11.6	Complementary Pivot Theory: Lemke's Iterative Method and Dantzig and Cottle's Principle Pivot Method for Solving the Fundamental Problem	159
	Exercises	162
	References	163
Appendix 1. Some Mathematical Background		
A.1.1	Linear Dependence of Vectors and Rank of a Matrix	166
A.1.2	Basic Solution to an Equality System and Graphical Representation	167
A.1.3	Theorem of Farkas	170
A.1.4	Some Properties of Functions, Linearity, Convexity, Quasi-Convexity and some Properties of Constraint Sets	173
A.1.5	Derivatives of Functions of Many Variables	176
A.1.6	Implicit Function Theorem	177
	Reference	178
Appendix 2. On Using a Linear Programming System		
A.2.1	Introduction	179
A.2.2	Input Format (MPS 360)	179
A.2.3	Systems Control Language and Systems Procedures	183
A.2.4	Setting Up and Running a Problem	186
	References	188
Appendix 3. UIMP: User Interface to Mathematical Programming a Modelling Language		
A.3.1	Introduction	191
A.3.2	An Overview of the Language and the basic Syntactic Components	191
A.3.3	Principle of Use and Modelling Tactics Illustrated by an Example	199
A.3.4	Some Ramifications of the Data Structure Facility, Data Definition and Data Entry	204
A.3.5	The Illustrative Example Fully Coded and Annotated	207
