

CONTENTS

PREFACE vii

- 1 FUNDAMENTALS OF THE THEORY 1
 - Systems and Higher Order Equations 12
 - A Numerical Method 19
 - Extension of the Theory 24
- 2 INTERPOLATION THEORY 26
- 3 ADAMS FORMULAS 41
- 4 CONVERGENCE AND STABILITY—
SMALL STEP SIZES 53
 - Asymptotic Development of Error 72
- 5 EFFICIENT IMPLEMENTATION OF THE
ADAMS METHODS 75
- 6 ERROR ESTIMATION AND CONTROL 95
- 7 ORDER AND STEP SIZE SELECTION 109
 - Accepting a Step and General Considerations 110
 - Order Selection 112
 - Step Size Selection 115
 - The Start Phase 118
 - Implications of the Algorithms 120
 - Global Error Estimation 122
- 8 STABILITY—LARGE STEP SIZES 126
- 9 COMPUTER ARITHMETIC 146

10	THE CODES	156
	Implementing the Codes	157
	Using the Codes	161
	DE, 162;	
	STEP, 173;	
	INTRP, 176;	
	Explanation of the Codes	178
	STEP, 178;	
	INTRP, 182;	
	DE, 182	
	Useful Extensions of the Codes	210
	A Root-Solver	223
11	CODE PERFORMANCE AND EVALUATION	232
12	TECHNIQUES, EXAMPLES, AND EXERCISES	260
	Error Control	260
	Efficient Evaluation of Partially Linear Equations	261
	Linear Independence and Boundary Value Problems	262
	Root Solving	269
	Transforming the Independent Variable	274
	Transforming Dependent Variables	278
	Singular Points	284
	A Final Problem	291
13	SOLUTIONS TO THE EXERCISES	294
	APPENDIX:	
	NOTATION AND SOME THEOREMS	
	FROM THE CALCULUS	311
	REFERENCES	315
	INDEX	317
