Notation	XIX
----------------	-----

Part I Introduction, basic concepts and preliminaries

1 Introduction	3
1.1 Basic concepts of fault diagnosis technique	4
1.2 Historical development and some relevant issues	8
1.3 Notes and references	11
2 Basic ideas, major issues and tools in the observer-based FDI framework	13
2.1 On the observer-based residual generator framework	13
2.2 Unknown input decoupling and fault isolation issues	14
2.3 Robustness issues in the observer-based FDI framework	15
2.4 On the parity space FDI framework	17
2.5 Residual evaluation and threshold computation	17
2.6 FDI system synthesis and design	18
2.7 Notes and references	18
3 Modelling of technical systems	21
3.1 Description of nominal system behavior	22
3.2 Coprime factorization technique	23
3.3 Representations of disturbed systems	25
3.4 Representations of system models with model uncertainties ...	25
3.5 Modelling of faults	27
3.6 Modelling of faults in closed loop feedback control systems ...	30
3.7 Benchmark examples	31
3.7.1 Speed control of a DC motor	31
3.7.2 Inverted pendulum control system	34
3.7.3 Three tank system	38

3.7.4	Vehicle lateral dynamic system	42
3.7.5	Electrohydraulic Servo-actuator	46
3.8	Notes and references	49
4	Structural fault detectability, isolability and identifiability .	51
4.1	Structural fault detectability	51
4.2	Excitations and sufficiently excited systems	56
4.3	Structural fault isolability	57
4.3.1	Concept of structural fault isolability	57
4.3.2	Fault isolability conditions.....	58
4.4	Structural fault identifiability	65
4.5	Notes and references	67

Part II Residual generation

5	Basic residual generation methods	71
5.1	Analytical redundancy	72
5.2	Residuals and parameterization of residual generators	75
5.3	Problems related to residual generator design and implementation	78
5.4	Fault detection filter	80
5.5	Diagnostic observer scheme	81
5.5.1	Construction of diagnostic observer-based residual generators	81
5.5.2	Characterization of solutions	83
5.5.3	A numerical approach	91
5.5.4	An algebraic approach	95
5.6	Parity space approach	97
5.6.1	Construction of parity relation based residual generators	98
5.6.2	Characterization of parity space	100
5.6.3	Examples	102
5.7	Interconnections, comparison and some remarks	103
5.7.1	Parity space approach and diagnostic observer	103
5.7.2	Diagnostic observer and residual generator of general form	107
5.7.3	Applications of the interconnections and some remarks .	110
5.7.4	Examples	112
5.8	Notes and references	114
6	Perfect unknown input decoupling	115
6.1	Problem formulation	115
6.2	Existence conditions of PUIDP	117
6.2.1	A general existence condition	117
6.2.2	A check condition via Rosenbrock system matrix	118

6.2.3	Algebraic check conditions	120
6.3	A frequency domain approach	125
6.4	UIFDF design	128
6.4.1	The eigenstructure assignment approach	128
6.4.2	Geometric approach	132
6.5	UIDO design	139
6.5.1	An algebraic approach	140
6.5.2	Unknown input observer approach	142
6.5.3	A matrix pencil approach to the UIDO design	147
6.5.4	A numerical approach to the UIDO design	150
6.6	Unknown input parity space approach	153
6.7	An alternative scheme - null matrix approach	153
6.8	Minimum order residual generator	154
6.8.1	Minimum order residual generator design by geometric approach	154
6.8.2	An alternative solution	156
6.9	Notes and references	159
7	Residual generation with enhanced robustness against unknown inputs	161
7.1	Mathematical and control theoretical preliminaries	162
7.1.1	Signal norms	163
7.1.2	System norms	165
7.1.3	Computation of \mathcal{H}_2 and \mathcal{H}_∞ norms	168
7.1.4	Singular value decomposition	169
7.1.5	Co-inner-outer factorization	170
7.1.6	Model matching problem	173
7.1.7	Essentials of the LMI technique	173
7.2	Kalman filter based residual generation	174
7.3	Approximation of UI-distribution matrix	178
7.3.1	Approximation of matrices E_d, F_d	178
7.3.2	Approximation of matrices $H_{d,s}$	180
7.3.3	Some remarks	182
7.4	Robustness, fault sensitivity and performance indices	184
7.4.1	Robustness and sensitivity	184
7.4.2	Performance indices: robustness vs. sensitivity	185
7.4.3	Relations between the performance indices	186
7.5	Optimal selection of parity matrices and vectors	187
7.5.1	$S_{f,+}/R_d$ as performance index	188
7.5.2	$S_{f,-}/R_d$ as performance index	191
7.5.3	J_{S-R} as performance index	193
7.5.4	Optimization performance and system order	195
7.5.5	Summary and some remarks	197
7.6	\mathcal{H}_∞ optimal fault identification scheme	201
7.7	$\mathcal{H}_2/\mathcal{H}_2$ design of residual generators	202

7.8 Relationship between $\mathcal{H}_2/\mathcal{H}_2$ design and optimal selection of parity vectors 206

7.9 LMI aided design of FDF 211

7.9.1 \mathcal{H}_2 to \mathcal{H}_2 trade-off design of FDF 213

7.9.2 On \mathcal{H}_- index 218

7.9.3 \mathcal{H}_2 to \mathcal{H}_- trade-off design of FDF 225

7.9.4 \mathcal{H}_∞ to \mathcal{H}_- trade-off design of FDF 227

7.9.5 An alternative \mathcal{H}_∞ to \mathcal{H}_- trade-off design of FDF 229

7.9.6 A brief summary and discussion 232

7.10 The unified solution 232

7.10.1 $\mathcal{H}_i/\mathcal{H}_\infty$ index and problem formulation 233

7.10.2 $\mathcal{H}_i/\mathcal{H}_\infty$ optimal design of FDF: the standard form 234

7.10.3 Discrete time version of the unified solution 237

7.11 The general form of the unified solution 238

7.11.1 Extended CIOF 238

7.11.2 Generalization of the unified solution 240

7.12 Notes and references 244

8 Residual generation with enhanced robustness against

model uncertainties 247

8.1 Preliminaries 248

8.1.1 LMI aided computation for system bounds 248

8.1.2 Stability of stochastically uncertain systems 249

8.2 Transforming model uncertainties into unknown inputs 250

8.3 Reference model strategies 252

8.3.1 Basic idea 252

8.3.2 A reference model based solution for systems with norm bounded uncertainties 252

8.4 Residual generation for systems with polytopic uncertainties .. 259

8.4.1 The reference model scheme based scheme 259

8.4.2 \mathcal{H}_- to \mathcal{H}_∞ design formulation 263

8.5 Residual generation for stochastically uncertain systems 265

8.5.1 System dynamics and statistical properties 266

8.5.2 Basic idea and problem formulation 266

8.5.3 An LMI solution 267

8.5.4 An alternative approach 274

8.6 Notes and references 276

Part III Residual evaluation and threshold computation

9 Norm based residual evaluation and threshold computation 281

9.1 Preliminaries 282

9.2 Basic concepts 284

9.3 Some standard evaluation functions 285

9.4 Basic ideas of threshold setting and problem formulation 287

9.4.1 Dynamics of the residual generator 288

9.4.2 Definitions of thresholds and problem formulation 289

9.5 Computation of $J_{th,RMS,2}$ 291

9.5.1 Computation of $J_{th,RMS,2}$ for the systems with the norm bounded uncertainty 292

9.5.2 Computation of $J_{th,RMS,2}$ for the systems with the polytopic uncertainty 295

9.6 Computation of $J_{th,peak,peak}$ 297

9.6.1 Computation of $J_{th,peak,peak}$ for the systems with the norm bounded uncertainty 297

9.6.2 Computation of $J_{th,peak,peak}$ for the systems with the polytopic uncertainty 301

9.7 Computation of $J_{th,peak,2}$ 302

9.7.1 Computation of $J_{th,peak,2}$ for the systems with the norm bounded uncertainty 302

9.7.2 Computation of $J_{th,peak,2}$ for the systems with the polytopic uncertainty 305

9.8 Threshold generator 307

9.9 Notes and references 310

10 Statistical methods based residual evaluation and threshold setting 311

10.1 Introduction 311

10.2 Elementary statistical methods 312

10.2.1 Basic hypothesis test 312

10.2.2 Likelihood ratio and generalized likelihood ratio 314

10.2.3 Vector-valued GLR 316

10.2.4 Detection of change in variance 317

10.2.5 Aspects of on-line realization 318

10.3 Criteria for threshold computation 320

10.3.1 The Neyman-Pearson criterion 320

10.3.2 Maximum a posteriori probability (MAP) criterion 321

10.3.3 Bayes' criterion 322

10.3.4 Some remarks 323

10.4 Application of GLR testing methods 324

10.4.1 Kalman filter based fault detection 324

10.4.2 Parity space based fault detection 330

10.5 Notes and references 333

11 Integration of norm based and statistical methods 335

11.1 Residual evaluation in stochastic systems with deterministic disturbances 335

11.1.1 Residual generation 336

11.1.2 Problem formulation 337

11.1.3 GLR solutions 338

11.1.4 Discussion and example 341

11.2 Residual evaluation scheme for stochastically uncertain systems 343

11.2.1 Problem formulation 343

11.2.2 Solution and design algorithms 345

11.3 Probabilistic robustness technique aided threshold computation 356

11.3.1 Problem formulation 356

11.3.2 Outline of the basic idea 358

11.3.3 LMIs needed for the solutions 359

11.3.4 Problem solutions in the probabilistic framework 360

11.3.5 An application example 362

11.3.6 Concluding remarks 364

11.4 Notes and references 364

Part IV Fault detection, isolation and identification schemes

12 Integrated design of fault detection systems 369

12.1 FAR and FDR 370

12.2 Maximization of fault detectability by a given FAR 373

12.2.1 Problem formulation 374

12.2.2 Essential form of the solution 374

12.2.3 A general solution 376

12.2.4 Interconnections and comparison 378

12.2.5 Examples 382

12.3 Minimizing false alarm number by a given FDR 386

12.3.1 Problem formulation 387

12.3.2 Essential form of the solution 388

12.3.3 The state space form 390

12.3.4 The extended form 391

12.3.5 Interpretation of the solutions and discussion 393

12.3.6 An example 396

12.4 On the application to stochastic systems 398

12.4.1 Application to maximizing FDR by a given FAR 398

12.4.2 Application to minimizing FAR by a given FDR 399

12.5 Notes and references 399

13	Fault isolation schemes	403
13.1	Essentials	404
13.1.1	Existence conditions for a perfect fault isolation	404
13.1.2	PFI and unknown input decoupling	406
13.1.3	PFI with unknown input decoupling (PFIUID)	409
13.2	A frequency domain approach	410
13.3	Fault isolation filter design	412
13.3.1	A design approach based on the duality to decoupling control	412
13.3.2	The geometric approach	415
13.3.3	A generalized design approach	417
13.4	An algebraic approach to fault isolation	426
13.5	Fault isolation using a bank of residual generators	431
13.5.1	The dedicated observer scheme (DOS)	432
13.5.2	The generalized observer scheme (GOS)	435
13.6	Notes and references	438
14	On fault identification	441
14.1	Fault identification filter and perfect fault identification	442
