

TABLE OF CONTENTS

PREFACE	vii
Chapter One-An Introduction to Dynamical Systems as Models	
1.1 Ecosystem Development in Terms of Ecology	1
1.2 State Space, or How to Add Apples and Oranges	3
1.3 Dynamical Systems as Treasure Hunts	6
Chapter Two-Simple Difference Equation Models	
2.1 Predator-Prey Difference Equation Dynamical Systems	20
2.2 Probabilistic Limit Cycles	25
Chapter Three-Formalizing the Notion of Stability	
3.1 The Concept of Ecosystem Stability	36
3.2 The Relation of Difference and Differential Equations	37
3.3 Limit Cycles	42
3.4 Lyapunov Theory	43
3.5 The Trapping of Trajectories	49
Chapter Four-Introduction to Ecosystem Models	
4.1 Brewing Beer and Yeast Population Dynamics	68
4.2 Attractor Trajectories	73
4.3 Derivatives of System Functions	78
4.4 The Linearization Theorem	80
4.5 The Hurwitz Stability Test	84
Chapter Five-Introduction to Ecosystem Models	
5.1 The Community Matrix	101
5.2 Predator-Prey Equations and Generalizations Thereof	103
5.3 Signed Digraphs	106
5.4 Qualitative Stability of Linear Systems	108
Chapter Six-Qualitative Stability of Ecosystem Models	
6.1 Qualitative Results in Modeling	128
6.2 Holistic Ecosystem Models	131
6.3 Holistic Ecosystem Models with Attractor Trajectories	133
Chapter Seven-The Behavior of Models with Attractor Regions	
7.1 Attractor Regions	144
7.2 The Lorenz Model	147
7.3 Elementary Ecosystem Models with Chaotic Dynamics	152
Chapter Eight-Holistic Ecosystem Models with Attractor Regions	
8.1 An Attractor Region Theorem	162
8.2 An Example	167

Chapter Nine-Sequencing Energy Flow Models to Account for Shortgrass Prairie Energy Dynamics

9.1 Energy Flow and Accumulation Modeling	173
9.2 Accumulation Modeling	174
9.3 Estimating Energy Flows	176
9.4 Equations and Trajectories	177
9.5 Stability	182

INDEX	191
