	List of authors	viii
	Acknowledgments	x
	Introduction (SEGEL)	1
	Mathematical applications	9
	Conventions	11
1	Biochemical reaction theory	13
	1.1 Fundamental concepts (RUBINOW and SEGEL)	13
	1.2 Equilibrium binding of macromolecules with ligands (RUBINOW)	19
	1.3 Allosteric and induced-fit theories of protein binding (RUBINOW)	30
	1.4 Positive and negative cooperativity (RUBINOW and SEGEL)	39
	1.5 Graphical representations for tetramer binding (GHOZLAN, RUBINOW and SEGEL)	55
	1.6 Enzyme induction (YAGIL)	68
	1.7 Molecular models for receptor to adenylate cyclase coupling (TOLKOVSKY and LEVITZKI)	84
2	Simplification of biochemical reaction systems (ZEIGLER)	112
	2.1 Introduction	112
	2.2 Essentials of lumping and homomorphism	116
	2.3 Representation and simulation of chemical networks	121
	2.4 Lumping of reactions	125
	2.5 Lumping chemicals into pools	128
	2.6 Lumping of reactions and of chemicals	131
	2.7 Assessment of error	137

	2.8 The simplification procedure and its application to the <i>E. coli</i> cell	139
	2.9 Conclusions	143
3	Biological applications of control theory (RAPP)	146
	3.1 Metabolic regulation as a control system	146
	3.2 Analysis of a linear, open loop control system	156
	3.3 Feedback in linear pathways	167
	3.4 Time delay and control loop stability	181
	3.5 The effect of different controllers	185
	3.6 Nonlinear models	186
	3.7 A negative feedback biochemical system: The Goodwin equations for $N = 3$	189
	3.8 Positive feedback in three dimensions	204
	3.9 Catastrophe theory	222
	3.10 Conclusions	235
4	Case studies in kinetics	248
	4.1 Models for oscillations and excitability in biochemical systems (GOLDBETER)	248
	4.2 Linear versus saturated rates in synaptic release (PARNAS)	292
	4.3 Optimal strategies for the metabolism of storage materials in unicellular and multicellular organisms (PARNAS)	317
	4.4 Acceptable and unacceptable models of liver regeneration in the rat (BARD)	336
	4.5 Chaos (PERELSON)	349
5	Mathematical immunology (PERELSON)	365
	5.1 An introduction to the immune system	365
	5.2 A mathematical look at clonal selection	372
	5.3 Models for the interaction of antigen with cells	376
	5.4 Application of control theory to immunology	404
	5.5 Theory of immunoassays	423
6	Some applications of partial differential equations in biology	440
	6.1 The general balance law and the diffusion equation (SEGEL)	440
	6.2 Transit times (HARDT)	453
	6.3 Facilitated diffusion (RUBINOW)	458

6.4 Morphogenetic patterns and reaction–diffusion equations (SEGEL)	470
6.5 Analysis of population chemotaxis (SEGEL)	486
6.6 Cell kinetics (RUBINOW)	502
6.7 Biological waves (ODELL)	523

7 Visual fixation and tracking in flies (WEHRHAHN)	568
7.1 Introduction	568
7.2 The phenomenological theory	577
7.3 Linear theory	587
7.4 Some aspects of the nonlinear theory	594
7.5 Discussion	599
7.6 Appendix	602

Appendix: Mathematical topics	606
A.1 A calculus refresher (SEGEL)	606
A.2 Miscellaneous algebraic topics (RAPP)	640
A.3 Qualitative theory of systems of ordinary differential equations, including phase plane analysis and the use of the Hopf bifurcation theorem (ODELL)	649
A.4 Dimensional analysis (SEGEL)	728
A.5 A brief introduction to the numerical solution of ordinary differential equations (LIRON)	733
