

Table of Contents

Preface	v
Introduction	vii
Section One. Energy from the Oceans	1
Power Generation from Ocean Waves—A Theoretical Review Brian M. Count	3
Three-Dimensional Wave Absorbers J. N. Newman	43
Bay of Fundy Tidal Power—Mathematical Studies David A. Greenberg	51
Fluid Mechanical Aspects of Ocean Thermal Energy Conversion Gerhard H. Jirka	83
Aerodynamics of Wind Turbines Robert E. Wilson	109
Section Two. Energy from the Ground	127
A Guide to Mathematical Models of Convection Processes in Geothermal Systems D. R. Kassoy	129
Application of the Galerkin Method to Thermal Convection in Porous Media Joe M. Straus	151
On Calculating Flows with Sharp Fronts in a Porous Medium N. Albright and P. Concus	172
Mathematical Aspects of Flows in Porous Media Wayne T. Ford	185
Section Three. Nuclear Reactor Cooling	197
Some Mathematical Problems in Nuclear Reactor Safety Analysis Donald A. Drew	199
Large Interaction Parameter Magnetohydrodynamics and Applications in Fusion Reactor Technology John S. Walker	215
Section Four. Combustion	231
Theoretical Aspects of Turbulent Reacting Flows Paul A. Libby	233
Activation-Energy Asymptotics in Turbulent Combustion G. S. S. Ludford and J. Buckmaster	263
Mathematical Modeling of in situ Oil Shale Retorting Processes John H. George, H. Gordon Harris and J. W. Thomas	276
Mathematical Challenges in the Modeling of Fluidized Bed Coal Combustors Christos Georgakis	292
List of Participants	314
