

CONTENTS

1. Introduction	1
Part I. Elements of the mathematical theory of optimal control	
Chap. I. Basic ideas and typical problems	
2. Phase trajectories and admissible controls	11
3. Definition of the controlled object and typical optimal control problems	26
Chap. II. Dynamic programming	
39	
4. The method of dynamic programming for discrete controlled processes	40
5. The dynamic programming method for continuous controlled processes	67
Chap. III. The maximum principle	
6. Connection of dynamic programming with the maximum principle for continuous controlled processes	79
7. Linear time-optimal problems	88
8. Non-linear problems with variable and free endpoints	103
Part II. Elements of the general theory of games	
Chap. IV. One stage games	
9. Games of n players	119
10. Zero-sum two-person games	133
Chap. V. Multistage games	
11. Multistage positional zero-sum two-person games	155
12. Dynamic programming in multistage games	167

Part III. Differential games

Chap. VI. Fundamental differential-game concepts

13. Differential games with piecewise-programmed strategies	192
14. The general scheme of a differential game	199
15. Simple examples of differential games	207

Chap. VII. Methods of solving differential games based on dynamic programming and the maximum principle

16. The dynamic programming method of solving differential games	214
17. Questions of the existence of a value of a differential game	228
18. Solution of differential games by the maximum principle	249

Chap. VIII. Some methods of investigating differential games not based on the maximum principle and dynamic programming

19. Differential games of evasion	254
20. The extrapolation method	258
21. A game of pursuit with several pursuers	267
