

## CONTENTS

### *Preface*

viii

## PART I. CLASSICAL PHYSICS

Chap. 1. <i>Mechanics</i>	1
1. Newtonian formulation, 3	
2. Lagrangean formulation, 15	
3. Hamiltonian formulation, 23	
Chap. 2. <i>Thermodynamics and Statistical Mechanics</i>	31
1. Temperature and heat, 33	
2. Classical statistical mechanics, 48	
Chap. 3. <i>Electromagnetism</i>	67
1. Phenomenological background, 68	
2. The nature of light, 79	

## PART II. RELATIVITY

Chap. 4. <i>Geometry</i>	91
1. Galilean and Minkowskian geometries, 91	
2. Curved space-time geometries, 101	
a. Differentiable manifolds, 102	
b. Tangent bundle, 109	
c. Riemannian and Lorentzian metrics, 110	
d. Levi-Cevita connection, 115	
e. Tensorial expressions of curvature, 123	
f. Covariant and exterior derivatives, 127	
Chap. 5. <i>The Principles of Special Relativity</i>	133
1. Formulation of the principles, 134	
2. Immediate consequences of the principles, 145	
Chap. 6. <i>General Relativity</i>	161
1. Models for space-time, 161	
2. Electromagnetism revisited, 186	
3. Models for matter, 191	

### PART III. QUANTUM THEORY

Chap. 7. <i>The 'old' quantum theory</i>	209
1. Black-body radiation, 211	
2. Electrons, photons and phonons, 220	
3. The structure of the atom, 232	
Chap. 8. <i>Hilbert space formulation of quantum mechanics</i>	249
1. The Heisenberg matrix formulation, 252	
2. The Schrödinger wave mechanics, 276	
3. Von Neumann's Hilbert space formalism, 295	
a. The states, 297	
b. The observables, 301	
c. The expectation values, 309	
d. Von Neumann algebras, 315	
e. Symmetries, 320	
f. The CCR for $n$ degrees of freedom, 333	
g. The classical limit, 339	
4. Quantum scattering theory, 345	
Chap. 9. <i>The algebraic formulation of quantum mechanics</i>	361
1. The fundamental postulate, 362	
a. Basic mathematical structures, 362	
b. Representations and GNS construction, 369	
c. Physical equivalence and quasi-equivalence, 375	
d. Physical meaning of the $C^*$ -algebraic postulate, 378	
2. Non-commutative ergodic theory, 383	
a. $C^*$ -inductive limits, 384	
b. Norm-asymptotic abelianness and observables at infinity, 386	
c. Averages over group actions, 402	
Chap. 10. <i>Systems with infinitely many degrees of freedom</i>	417
1. Quantum statistical mechanics, 417	
a. Canonical equilibrium for finite systems, 418	
b. KMS condition and modular actions, 432	
c. Canonical equilibrium for infinite quantum lattices, 444	
d. Ideal Fermi and Bose gases, 456	
e. Spontaneous symmetry-breaking and stability, 474	
f. Non-equilibrium quantum statistical mechanics, 483	
2. Quantum field theory, 500	
a. Elementary quantum systems in special relativity, 500	
b. The relativistic Fock spaces, 504	
c. Towards a general theory of quantum fields, 508
