

Contents

<i>Chapter 1</i>	<i>Introduction</i>	1
<i>Chapter 2</i>	<i>Dimensional Analysis and the Pi Theorem</i>	8
	<i>Units and Dimensions</i>	8
2-1	Units and Dimensions	8
2-2	Types of Quantities Appearing in Physical Equations	9
	<i>a. Primary and Secondary Quantities</i>	10
	<i>b. Physical Constants and Independent Dimensions</i>	12
	<i>c. Nondimensional Quantities</i>	14
2-3	Dimensional Homogeneity of Physical Equations	15
2-4	Statement and Use of the Pi Theorem	16
2-5	Rationale of the Pi Theorem	22
2-6	Huntley's Addition	23
2-7	Examples of Application of Dimensional Analysis	24
2-8	Summary	34

Chapter 3		36
<i>Method of Similitude and Introduction to Fractional Analysis of Overall Equations</i>		
3-1	Introduction	36
3-2	Method of Similitude	37
	<i>a.</i> Use of Force Ratios	38
	<i>b.</i> Generalization of the Method of Similitude	41
	<i>c.</i> Some Energy Ratios of Heat Transfer	49
3-3	Direct Use of Governing Overall Equations	53
3-4	Concluding Remarks	66
Chapter 4		68
<i>Fractional Analysis of Governing Equations and Conditions</i>		
4-1	Introduction	68
4-2	Normalization of the Governing Equations	70
	<i>a.</i> A Procedure for Normalization	70
	<i>b.</i> Meaning of Normalized Governing Equations	74
4-3	Conditions Required for Rigorous Solution of the Canonical Problem of Similitude and Dimensional Analysis Using Normalized Governing Equations	80
4-4	Basis of Improved Correlations	84
	<i>a.</i> General Basis	84
	<i>b.</i> Homogeneous Equations	85
4-5	Relations among Elementary Processes	87
	<i>a.</i> Model Laws, Similitude, and Analogues	87
	<i>b.</i> An Alternative Procedure	89
	<i>c.</i> A Remark on Force Ratios	91
	<i>d.</i> Relation among Dimensional Analysis, Governing Equations, and Boundary Conditions; Internal and External Similarity	92
4-6	Approximation Theory	94
	<i>a.</i> Extension to New Classes of Information by Approximation Theory	94
	<i>b.</i> Classification of Problems and Difficulties in Approximation Theory	98
	<i>c.</i> Conditions Required for Approximation Theory	101
4-7	Some Problems Involving Uniform Behavior	118
4-8	Nonuniform Behavior—Boundary Layer Methods	127
	<i>a.</i> Use of Physical Data Alone	127
	<i>b.</i> Zonal Estimates	146
4-9	Nonuniform Behavior—Expansion Methods and Uniformization	151
	<i>a.</i> Poincaré's Expansion	153
	<i>b.</i> Lighthill's Expansion	158
	<i>c.</i> WKB Expansion	162
	<i>d.</i> Inner and Outer Expansions	163
4-10	Processes Involving Transformations of Variables	163
	<i>a.</i> Absorption of Parameters and Natural Coordinates	164
	<i>b.</i> Supersonic and Transonic Similarity Rules	172
	<i>c.</i> Reduction in Number of Independent Variables—Separation and Similarity Coordinates	179
4-11	Summary and Conclusions	196
	<i>a.</i> Classification of Types of Similitude—Information Achievable from Fractional Analysis of Governing Equations	196

<i>b.</i> Various Viewpoints—Relations among Invariance, Transformations, and Similitude	199
<i>c.</i> Final Remarks	200
Chapter 5 <i>Summary and Comparison of Methods</i>	202
5-1 Introduction	202
5-2 Summary of Methods	203
<i>a.</i> The Pi Theorem	203
<i>b.</i> The Method of Similitude	203
<i>c.</i> Use of Governing Equations	204
5-3 Comparison of Methods	206
<i>a.</i> Power	206
<i>b.</i> Rigor	208
<i>c.</i> Accuracy	208
<i>d.</i> Simplicity	212
<i>e.</i> Input Information	212
5-4 Concluding Remarks	213
<i>a.</i> Utility of Various Methods	213
<i>b.</i> Implications in Teaching	215
<i>c.</i> Possible Further Development	216
<i>d.</i> Final Remark	218
