Preface	v
1 Simulation and modeling of updrain TMOS devices	1
1.1 Applications	1
1.2 Structure of a smart power device	2
1.3 Mathematical models	5
1.4 Solution to problem (1)	12
1.5 Partial solution to problem (3)	14
1.6 References	19
2 Strategic risk management using stochastic programming	20
2.1 Dynamic programming	20
2.2 Stochastic programming	22
2.3 Bundling	23
2.4 Epiconsistency	26
2.5 Future directions	27
2.6 References	28
3 Discrete fluids using lattice gas methods	29
3.1 Computational aeroacoustics	29
3.2 Lattice gas methods	30
3.3 Hypercubic lattice	32
3.3.1 Aerodynamic studies	36
3.3.2 Acoustic study	36
3.4 Open opportunities	37
3.5 References	38
4 Computer-aided design of developable surfaces	39
4.1 Developable surfaces	40
4.2 Properties of developable surfaces	42
4.3 Developable Bézier surfaces	44
4.4 Open problems	47

4.5	References	49
5	Modeling techniques for computation of coating flows	50
5.1	Coating configuration	50
5.2	The governing equations	51
5.3	Fluid flow in a slot	53
5.4	Inclined boundary	59
5.5	References	61
6	Measuring coalescence rates	62
6.1	The coalescence problem	62
6.2	Introducing chemiluminescent species	65
6.3	Results and open problems	67
6.4	Partial solutions	69
6.5	References	70
7	The light field for diffusely scattering media	72
7.1	The problem	72
7.2	Radiation transfer	73
7.3	Modulation transfer function	74
7.4	Solving for I	76
7.5	Further questions	78
7.6	References	78
8	The changing nature of network traffic analysis and modeling	80
8.1	Motivation	80
8.2	Changes and challenges	81
8.3	Self-similar processes	82
8.4	An example	84
8.5	Open problems	86
8.6	References	88
9	Stress-induced warpage in micro-accelerometers	90
9.1	Micro-accelerometers	90
9.2	Warping in micro-accelerometers	93
9.3	Buckling of micromachined structure	96
9.4	Solution to problem (1)	100
9.5	References	102
10	Exchange energy representations in computational micromagnetics	103
10.1	Micromagnetic structure	104
10.2	The Landau–Lifshitz–Gilbert equation	106
10.3	Numerical methods	108

10.4	Open problem	110
10.5	References	114
11	Nonlinear effects in electrorheological fluids	115
11.1	Electrorheological fluids	115
11.2	An integral equation approach	118
11.3	A time dependent model	123
11.4	Open problems	124
11.5	Solution to problems (1)(2)	125
11.6	References	128
12	Modeling of a building cooling system	129
12.1	Cooling systems terminology	129
12.2	A cooling system diagram	132
12.3	Statement of the problem	133
12.4	Dynamic equations	136
12.5	Open problems	139
12.6	References	140
13	Mass transport and adsorption in particle-loaded beds	141
13.1	Adsorption measurements	141
13.2	A mathematical model	144
13.3	A simplified model	146
13.4	Numerical and experimental results	147
13.5	References	148
14	Growth instability in metal electrodeposition	149
14.1	The Hull cell	150
14.2	Model equations	153
14.3	Open problems	156
14.4	References	158
15	Simulation of production metal cutting processes	160
15.1	Metal cutting process	160
15.2	Model equations	161
15.3	Numerical results	166
15.4	References	167
16	Application of inverse scattering to oil field evaluation problems	169
16.1	Extended Born approximation	169
16.2	An inversion approach	174
16.3	Imaging pits in corroded steel casings	176
16.4	References	178

17 Solutions to problems from previous parts	179
17.1 Part 5	179
17.2 Part 7	179
17.3 Part 9	180
17.4 References	181
Index	182
