Preface	v
1 Dealing with geometric variations in manufacturing	1
1.1 Tolerancing	1
1.2 Metrology	5
1.3 Mathematical issues	6
1.4 References	8
2 Interdisciplinary computational fluid dynamics	10
2.1 Industrial interdisciplinary CFD	10
2.2 Thermal flow and combustion model	13
2.3 References	17
3 A mathematical model of a crystallizer	18
3.1 The physical model	18
3.2 Mathematical model for CSTR mixer	20
3.3 Mathematical model for PFR mixer	23
3.4 Scaling	25
3.5 Numerical results	27
3.6 References	28
4 Randomized algorithms in industrial problems	29
4.1 Programmable logical array (PLA)	29
4.2 Gate arrays	33
4.3 Printed circuit board (PCB)	34
4.4 References	36
5 Global geodesic coordinates on a G_0 continuous surface	37
5.1 Basic problems	38
5.2 Geodesics on a smooth surface	38
5.3 Geodesics on non-smooth surfaces	44
5.4 References	46

6	Micromechanics effects in creep metal-matrix composites	48
6.1	Metal-matrix composites	48
6.2	The unreinforced model	48
6.3	The composite problem	52
6.4	References	55
7	Seismic inversion for geophysical prospecting	56
7.1	Data acquisition	56
7.2	Some traditional data processing steps	57
7.3	Multiparameter inversion	61
7.4	Open problems	64
7.5	References	65
8	Simulations for etch/deposition profile evolution	66
8.1	The problem	66
8.2	Mathematical formulation	68
8.3	Numerical results	70
8.4	Open problems	72
8.5	References	75
9	Analysis of cellular mobile radio	77
9.1	A cellular mobile radio system	77
9.2	Traditional queueing networks	80
9.3	An interacting queue model	83
9.4	Open problems	88
9.5	References	88
10	A pseudo non-time-splitting scheme in air quality modeling	89
10.1	The model	89
10.2	The pseudo non-time-splitting method	91
10.3	Numerical results	91
10.4	References	93
11	Fluid flow in a porous medium	94
11.1	The problem	94
11.2	The quasi-stationary 2-d model	96
11.3	Numerical results	98
11.4	Need for another model	100
11.5	Open problems	101
11.6	References	105

12 Robots, mechanisms and polynomial continuation	106
12.1 Examples	108
12.2 Polynomial continuation	110
12.3 The Stewart platform	112
12.4 Open questions	113
12.5 References	114
13 Failure times in metal lines	116
13.1 Electromigration	116
13.2 A mathematical model	117
13.3 Another model	119
13.4 Analysis of the solution	121
13.5 References	125
14 Surface modeling: impacts of design and manufacturing	126
14.1 Patched surfaces	126
14.2 Feature-based approach	129
14.3 Free-form deformation	131
14.4 References	134
15 Chemical filtration modeling	135
15.1 The chemistry of absorption	135
15.2 The occurrence of absorption	138
15.3 A recirculation model	139
15.4 Open problems	142
15.5 References	142
16 The element-free Galerkin method in large deformations	144
16.1 Large deformations	144
16.2 Moving least square interpolants	146
16.3 Kinematics of large deformations of continua	147
16.4 The EFG method	149
16.5 Proposed further research	152
16.6 References	152
17 Aeroacoustic research in the automotive industry	154
17.1 Basic acoustics	154
17.2 Mathematical modeling of sound	158
17.3 Acoustic source models	160
17.4 The antenna model	163
17.5 Open problems	167
17.6 References	168

18 Synchronization for chaotic dynamical systems	169
18.1 Synchronization	169
18.2 General definition of synchronization	171
18.3 Conditional Lyapunov exponents	173
18.4 Chaotic signal masking	175
18.5 Controlling chaos	175
18.6 References	177
19 Solutions to problems from part 7	178
19.1 Chapter 2	178
19.2 Chapter 3	178
19.3 Chapter 4	179
19.4 Chapter 14	180
19.5 Chapter 20	180
19.6 References	182
Index	183
