Contents

Preliminaries 1

1 Mathematical symbols 1
2 Subscripts and superscripts 2
3 The three dots notation 2
4 What is finite mathematics? 4
5 Prime numbers 5
6 The absolute value notation 5
7 The proof is completed 6
8 More minor items 6

Logic 7

1 Statements 8
2 Symbols for the three simplest connectives 10
3 Truth tables 13
4 Two more connectives 17
5 Tautology and contradiction 22
6 Implication and equivalence 23
7 On the validity of an argument 28
*8 Design of switching networks 33
Review problems 38

2 The algebra of sets 39

1 Sets, subsets, and supersets 39
2 Complements, unions, and intersections 46
3 The distributive laws for sets 56
4 The number of elements in a set 62
5 Tree diagrams 71
*6 The relation between set theory and logic 75
*7 Voting coalitions 78
Review problems 80

3 Elementary combinatorial analysis 82

1 Two simple examples 82
2 Permutations and the factorial notation 85
3 Combinations 91
*4 More difficult problems 95
Review problems 99

4 The binomial theorem and related topics 101

1 The Σ notation 101
2 The binomial theorem 107
*3 The Pascal triangle 113
4 Partitions 115
5 The multinomial theorem 121
Review problems 125

5 Probability 126

1 Some simple examples 126
2 Probability functions 136
*3 Games 141
*4 The Kaos problem 145
5 Conditional probability 147
6 Independent events 156

*7 Bayes' theorem 161
8 Bernoulli trials 167
9 Expected value 173
*10 Odds 183
*11 The birthday paradox 185
*12 Keno 186
Review problems 190

6 Further topics in probability 191

1 Stochastic processes 191
2 Markov chains 196
*3 Gambler's ruin 203
Review problems 210

7 A little statistics 212

1 The organization of statistics 213
2 Measures of central tendency 219
3 Measures of dispersion 221
4 Population parameters and sample statistics 225
*5 Testing a hypothesis 230
*6 The law of large numbers 236
*7 The DeMoivre-Laplace limit theorem 239
Review problems 248

8 Vectors and matrices 250

1 Vectors 250
2 Geometric representation of a vector 256
3 The multiplication of vectors 262
4 Matrices 265
5 Addition of matrices 270
6 Multiplication of matrices 273
*7 The transpose of a matrix 280
Review problems 283

9 Applications of matrices 286

1 Systems of linear equations 286
2 The inverse of a matrix 297
3 Markov chains 305
4 Absorbing Markov chains 316
*5 Genetics 324
Review problems 330

10 Linear programming: Geometric approach 331

1 Linear inequalities 331
2 Linear programming problems 338
3 Solving linear programming problems 344
Review problems 354

11 Linear programming: Algebraic method 355

1 Preliminaries 355
2 Basic solutions 362
3 The simplex method 366
4 Duality 374
Review problems 381

12 The theory of games 383

1 Matrix games 384
2 The value of a game 389
3 Strictly determined games 395
4 2×2 matrix games 399
5 $m \times n$ matrix games 404
Review problems 411

13 Applications to the social sciences 412

1 Theories and models 412
2 A model for paired-associate learning 413
3 The Leontief input-output model 425
Review problems 439

14 Graph theory and its applications 440

1 Graphs and their representations 440
2 Diagraphs 446
3 Distances in a graph 453
4 Tournaments 457
5 The detection of cliques 464
6 The Königsberg bridge problem and generalizations 469
Review problems 474

APPENDIX 1 Functions and function notation 477

1 The concept of a function 477
2 Function notation 481
3 The graph of a function 483
4 The modern definition of a function 487

APPENDIX 2 Inequalities 489

1 The elementary theorems 489
2 Conditional inequalities 498

APPENDIX 3 Mathematical induction 502

1 The nature of mathematical induction 502
2 The general principle 505
3 Further examples 506

APPENDIX 4 A general counting theorem 510

1 The notation for a product 510
2 A general counting theorem 513

APPENDIX 5 Gambler's ruin 519

TABLES 523

A Binomial coefficients $\binom{n}{k} = C(n, k)$ 524
B Values of $b(k, n, p)$ 526
C Areas under the unit normal curve 528

Answers to odd-numbered problems 531

Index of selected symbols 569
