

# Contents

I	PRELIMINARY	1
§1	Introduction	1
1.1	Statement of the Problem	1
1.2	Examples	2
1.3	Outline	3
§2	An Appropriate Concept of Measure	6
2.1	Q-Measure	6
2.2	Lemmata	7
II	INTEGRAL CHARACTERIZATIONS OF GLOBAL OPTIMALITY	9
§1	Mean Value Conditions	9
1.1	Mean Value over Level Sets	10
1.2	A Limit-Based Definition	14
1.3	Mean Value Conditions	16
§2	Variance and Higher Moment Conditions	17
2.1	Variance over Level Sets	18
2.2	A Limit-Based Definition	23
2.3	Variance Conditions	24
2.4	Higher Moments	26
2.5	Higher Moment Conditions	29
§3	The Constrained Cases	32
3.1	Rejection Conditions	32
3.2	Reduction Conditions	34
3.3	Linear Equality Constraints	37
§4	Penalty Global Optimality Conditions	45
4.1	Penalty Mean Value	45
4.2	Penalty Mean Value Conditions	49
4.3	Penalty Variance and Higher Moment Conditions	50
§5	Convex Programming	54
5.1	Optimality Conditions for Differentiable Convex Functions	54
5.2	Optimality Lemmas	56
5.3	Optimality Conditions for Convex Minimization	59
5.4	Generalized Gradient	63
§6	Optimality Conditions for Differentiable Functions	67
6.1	General Discussion: the Unconstrained Case	68
6.2	The Inequality Constrained Case in $\mathbb{R}^n$	70
6.3	Equality and Inequality Constrained Cases in $\mathbb{R}^n$	72

§7	Integer and Mixed Programming	74
	7.1 Integer Minimization Problems	74
	7.2 Optimality Conditions	75
	7.3 Mixed Minimization Problems	77
§8	Optimality Conditions for a Class of Discontinuous Functions	80
	8.1 Robust Sets	80
	8.2 The Structure of a Robust Set on the Real Line $\mathbb{R}$	83
	8.3 Robust Continuity	84
	8.4 Optimality Conditions	86
III	THEORETICAL ALGORITHMS AND TECHNIQUES	88
§1	The Mean Value-Level Set (M-L) Method	88
	1.1 Algorithm	89
	1.2 Convergence	90
	1.3 The Actual Descent Property	91
	1.4 The Influence of Errors	93
§2	The Rejection and Reduction Methods	95
	2.1 The Rejection Method	95
	2.2 The Reduction Method	97
	2.3 The Reduction Method for Linear Equality Constrained Cases in $\mathbb{R}^n$	99
§3	Global SUMT and Discontinuous Penalty Functions	101
	3.1 SUMT and the Set of Global Minima	102
	3.2 Discontinuous Penalty Functions	106
§4	The Nonsequential Penalty Method	108
	4.1 Construction	109
	4.2 Convergence	113
§5	The Technique of Adaptive Change of Search Domain	114
	5.1 A Simple Model	115
	5.2 Convergence	116
	5.3 Optimality Conditions of the Simple Model	118
	5.4 The General Model	120
§6	Stability of Global Minimization	122
	6.1 Continuity of Mean Value	122
	6.2 Stability of Global Minima	125
§7	Lower Dimensional Approximation	128
	7.1 Approximation of Global Minimum	129
	7.2 Estimation of Degree of Approximation	130

IV MONTE CARLO IMPLEMENTATION	132
§1 A Simple Model of Implementation	133
1.1 The Model	133
1.2 Monte Carlo Implementation	135
1.3 The Flow Chart	136
§2 Statistical Analysis of the Simple Model	137
2.1 Estimators of the Search Domains	137
2.2 The Probability of Escape and the Sample Size	139
2.3 Asymtotic Estimation of the Amount of Computation	140
§3 Strategies of Adaptive Change of Search Domains	143
3.1 Strategies	143
3.2 The Change of Domain Theorem	145
3.3 Reduction of the Skew Rate	147
§4 Remarks on Other Models	148
4.1 Rejection and Reduction Models	148
4.2 Integer and Mixed Programming	150
4.3 The Multi-Solution Model	151
§5 Numerical Tests	152
V APPLICATIONS	156
§1 Unconstrained Problems	156
1.1 Automatic Design of Optical Thin Films	156
1.2 Optimal Design of an Equalizer Network	160
§2 Applications of the Rejection Method	161
2.1 Optimal Design of Optical Phase Filters	162
2.2 Optimal Design of an Automatic Transmission Line Attenuation Compensation Network	163
§3 Applications of the Reduction Method	167
3.1 Optimal Design of a Turbine Wheel	168
3.2 Nonlinear Observation and Identification	170
§4 An Application of the Penalty Method	173
4.1 Weight Minimization of a Speed Reducer	173
§5 An Application of Integer and Mixed Programming	175
5.1 Optimal Design of an Optical Thin Film System	175
Bibliography	177
