Preface

xi

Chapter 1 The Construction of Models

1.1	Introduction	1
	<i>The Need for Models; Simplification of the Problem; Microscopic and Macroscopic Approaches; Ideal and Nonideal Gases; Systems of Interacting Particles; Examples of the Microscopic Approach; Examples of the Macroscopic Approach; Other Applications of Models</i>	
1.2	The Atomic Nucleus	8
	<i>The Need for Nuclear Models; The Liquid-Drop Model; The Shell Model; Compound Nucleus and Optical Models; Use of Conflicting Simple Models</i>	
1.3	The Quark Model of Elementary Particles	13
	<i>Definition of Elementary Particles; Classification of Particles; *Symmetry Groupings; The Quark Model; Modifications of the Quark Model; Experimental Confirmation and Outstanding Problems</i>	
1.4	Elementary Excitation in Solids	19
	<i>The Free-Electron Model; Normal Coordinates; Quasi-particles; The Successes and Failures of the Free-Electron Model; *Magnetic Properties of the Electron Gas; Different Types of Elementary Excitations in Solids</i>	
1.5	Steady-State Space-Charge-Limited Currents in Insulators	27
	<i>Description of the System; Construction and Analysis of an Idealized Model; Simplification of the Model; Solutions for Extreme Cases</i>	
1.6	Boundary Layer Theory in Hydrodynamics	31
	<i>The Equations of Motion for a Fluid; The Flow of Fluid past a Solid Body; Simplification of the Hydrodynamic Equations</i>	

Chapter 2 Dimensional Analysis

2.1	Introduction	36
	<i>Fundamental and Derived Units; Derivation of Formulas; Nonlinear Heat Conduction; Dimensionless Equations; Hydrodynamic Modeling; Phase Transitions; The Ising Model; Scaling Theory</i>	
2.2	The Derivation of Formulas by Dimensional Analysis	52
	<i>The Π Theorem; Planetary Motion; Electrical Units; Space-Charge-Limited Currents; Vector Lengths; The Thermal Conductivity of a Gas</i>	
2.3	Simple Derivation of Physical Laws	59
	<i>Motion in a Potential Field; *Statistical Physics; *Equation of State of Fermi and Bose Gases</i>	
2.4	Dimensionless Equations and Physical Similarity	64
	<i>*The Electrical Charge Distribution in Atoms—The Thomas-Fermi Equation; Heat Conduction in a Cubic Block; Equations Involving Parameters; Hydrodynamic Modeling</i>	

†An asterisk denotes an advanced topic, as explained in the preface.

2.5	Modern Theory of Critical Phenomena <i>The Renormalization Group; *An Application of the Renormalization Group Theory</i>	72
	Problems	80
Chapter 3 Symmetry		
3.1	Introduction <i>Classical Mechanics; Frames of Reference and Relativity; Quantum Mechanics; *Classical Electrodynamics; Elementary Particles; Molecular Vibrations; Symmetry of Crystal Structures; Symmetry of the Properties of Crystals; *The Symmetry of Kinetic Coefficients—Onsager's Principle; Order-Disorder Phase Transitions</i>	84
3.2	Conservation Laws in Quantum Mechanics <i>Quantum-Mechanical Formulation of Conservation Laws; The Conservation of Energy, Momentum, and Angular Momentum; Parity; Time-Reversal Symmetry in Classical Physics; Time-Reversal Symmetry and Irreversibility; Time-Reversal Symmetry in Quantum Mechanics; Indistinguishable Particles; Gauge Invariance and Charge Conservation; Charge Conjugation</i>	109
3.3	Symmetry and the Microscopic Properties of Systems <i>The Symmetry of Eigenfunctions; Matrix Elements and Selection Rules; *Irreducible Representations of Groups; One-Dimensional Representations; The Translational Symmetry of Crystals; Selection Rules for Crystals; *Irreducible Representations of a Crystal's Space Group; *Structural Phase Transitions in Crystals; *Integrals over the First Brillouin Zone</i>	124
3.4	The Inversion Symmetry and Magnetic Symmetry of Crystal Properties <i>Inversion Symmetry—Polar and Axial Tensors; Optical Activity; Time-Reversal Symmetry—i-Tensors and c-Tensors; Magnetic Systems; Magnetic Point Groups; Pyromagnetism and Piezomagnetism; The Magnetoelectric Effect</i>	139
	Problems	148
Chapter 4 Analytical and Related Properties		
4.1	Introduction <i>*Phase Transition Points; Singularities and Analytical Relationships; Singularities in Quantum Mechanics; The Dielectric Constant of Model Systems; Dispersion Relations; Sum Rules; Causality and Time-Reversal Symmetry; Fluctuations and Dissipation</i>	152
4.2	Analytic Properties of the Scattering Matrix <i>Scattering Amplitudes and the S-Matrix; *Analytical Properties of the S-Matrix; Scattering by a Square Well Potential; *Dispersion Relations</i>	167
4.3	Dispersion Relations for Macroscopic Systems <i>Convergence Conditions; Applications of Dispersion Relations; Quantum-Mechanical Approach; Calculation of the Dielectric Constant; Oscillator Strengths and Quantum-Mechanical Sum Rules; Additional Sum Rules; The Physical Meaning of Sum Rules and Dispersion Relations.</i>	172
4.4	The Fluctuation-Dissipation Theorem <i>Fluctuations of Extensive Variables; Time Correlation Functions; The Fluctuation-Dissipation Theorem; Application of the Fluctuation-</i>	186

*Dissipation Theorem: Energy Density of Radiation Field; *Time-Dependent Correlation Functions and Transport Coefficients; The Electrical Conductivity; The Electrical Susceptibility of a Dielectric Medium*

Problems

197

Chapter 5 The Method of the Small Parameter

5.1 Introduction

200

A Typical Problem; Perturbation Theory—The Series Expansion Technique; Solution for a Problem with Two Boundary Conditions at the Same Point; Renormalization Techniques; Eigenvalue Problems; Rayleigh–Schrödinger Perturbation Theory; Mathieu’s Equation; Brillouin–Wigner Perturbation Theory; Choice of the Small Parameter; Density Expansion of Transport Coefficients; Low-Density Systems of Charged Particles; The High-Density Electron Gas; Breakdown of Perturbation Theory; Decrease of the Order of a Differential Equation

5.2 Integral Equation Formulations of Perturbation Theory

223

*Integral Equations; Green’s Functions; Brillouin–Wigner and Rayleigh–Schrödinger Perturbation Theory; *Convergence of the Perturbation Series; Scattering Theory—The First Born Approximation; Dyson’s Equation*

5.3 Choice of the Small Parameter

232

**Quantum-Mechanical Description of a System of Nuclei and Electrons; Degenerate Systems with Two Perturbations; *Flexible Choice of the Perturbation*

5.4 Difficulties in the Use of the Small Parameter

241

*A Small Parameter Multiplying the Highest Derivative; *The Effective Mass Approximation; *Magnetic Interactions of Nuclei through Conduction Electrons*

Problems

246

Chapter 6 Epilogue—Example of the Application of the Above Methods to a Problem in Nonlinear Optics

6.1 Introduction

250

6.2 Model System

251

Analysis of the Model; The Model’s Limitations

6.3 Nonlinear Susceptibilities

255

Nonlinear Response Functions; Free Energy and Intrinsic Symmetry; Second Harmonic Generation in KDP

6.4 Use of Perturbation Theory

258

Preparation of the Problem for Perturbation Theory; Application of Perturbation Theory; Conclusions

References
