I. Functions of complex variables. By F. SOMMER	1
§ 1. Preliminaries	1
1.1 Holomorphic functions. Cauchy's integral theorem	1
1.2 Analytic continuation. Riemann surfaces	5
1.3 Expansions. The Laurent series	7
1.4 Singularities	8
§ 2. The calculus of residues	9
2.1 The residue.	9
2.2 The residue theorem	10
2.3 Applications of the residue theorem	11
§ 3. Conformal mapping. Harmonic functions	15
3.1 Holomorphic and conformal mappings	15
3.2 Linear transformations.	16
3.3 The Riemann mapping theorem	17
3.4 Harmonic functions	18
3.5 Applications in physics.	21
§ 4. Asymptotic expansions	27
§ 5. Laplace transformation	32
§ 6. Fourier transformation	39
§ 7. Several complex variables	49
Bibliography	51
II. Theory of distributions. By E. M. DE JAGER	52
§ 1. Elementary theory of distributions	52
1.1 Testfunctions and distributions	52
1.2 The spaces D and D'	53
1.3 The spaces S and S'	55
1.4 Relations between the spaces D , S , D' and S'	56
1.5 Global and local properties of distributions	57
1.6 Operations on distributions in D' or S'	58
§ 2. Several characterizations of distributions	62
2.1 Distributions as generalized derivatives of continuous functions.	62
2.2 The convolution of distributions.	64
2.3 Distributions as generalized limits of C^∞ functions	69
2.4 Representation of distributions by analytic functions	72

§ 3. Surface distributions	75
§ 4. Regularization of functions with algebraic singularities	79
4.1 Function of one independent variable	79
4.2 The distributions r^λ	85
4.3 The distributions of MARCEL RIESZ	87
§ 5. Fourier transformation of distributions	95
5.1 General theory	95
5.2 Multiplication and convolution	98
5.3 Fourier transforms and analytic functions	101
§ 6. Some applications of distribution theory to partial differential equations	103
Bibliography	108
III. Exterior differential forms. By G. A. DESCHAMPS	111
§ 1. Introduction	111
§ 2. Vector spaces	111
2.1 Definition	111
2.2 Dual spaces	113
2.3 Linear transformations.	114
2.4 Metric vector spaces	114
§ 3. Tensors	116
3.1 Tensor product of vector spaces	116
3.2 Transformation laws.	117
3.3 Symmetric and skew symmetric tensors.	118
§ 4. Exterior algebra	119
4.1 Definition	119
4.2 Multivectors	120
4.3 Interpretation of the exterior product	121
4.4 Duality	121
4.5 Transformation laws.	122
4.6 Inner product.	122
4.7 Metric	124
4.8 Hodge duality and star operator.	124
§ 5. Exterior differential forms	126
5.1 Definition	126
5.2 Mapping	127
5.3 Exterior differential	127
5.4 Poincaré's theorem	128
5.5 Forms over manifolds	129
5.6 Vectors and vector fields over manifolds	129
§ 6. Integration	131
6.1 Integration of forms	131
6.2 Effect of a mapping	131

6.3	Boundary of a chain	133
6.4	Stokes' theorem	133
6.5	Integration by parts	134
6.6	Metric spaces	134
6.7	Integration over a moving domain	135
§ 7.	Applications to mechanics and optics	138
7.1	The action principle	138
7.2	Equation of motion	139
7.3	Integral invariants	140
7.4	Fermat's principle	141
7.5	Integral invariants in optics	143
7.6	Malus-Dupin theorem	144
7.7	Hamiltonian systems	145
7.8	Conservation laws	147
§ 8.	Applications to electromagnetism and relativity	147
8.1	Special relativity	147
8.2	Motion of a charge in an electromagnetic field	150
8.3	Equations of electromagnetism in 4-space	152
8.4	Equations of electromagnetism in 3-space	153
8.5	Conservation equations	156
§ 9.	Comparison with conventional notations	157
9.1	Vector analysis	157
9.2	Equations of electromagnetism	159
§ 10.	Conclusions	160
	Bibliography	161
IV.	Ordinary differential equations. By A. N. TIHONOV, A. B. VA-SIL'EVA, and V. M. VOLOSOV	162
§ 1.	General theory	162
1.1	Concept of the ordinary differential equation	162
1.2	The concept of the solution of a differential equation	163
1.3	Cauchy problem. The existence and uniqueness considerations. Euler's algorithm	164
1.4	The dependence of the solutions on the initial values and on the parameters	174
1.5	Some other forms of additional conditions for the determination of a particular solution	180
§ 2.	Linear differential equation	184
2.1	General theory	184
2.1.1	General properties of linear equations	184
2.1.2	Systems of the linear differential equations of the first order	184

2.1.3	Linear n -th order differential equation.	187
2.2	Linear equations with constant coefficients	188
2.3	Construction of the solution of a linear system with the aid of series	190
2.4	Equations with periodic coefficients	191
§ 3.	Boundary-value problems for second order equations	192
3.1	Formulation of boundary-value problems and their physical substance.	192
3.2	Non-homogeneous boundary-value problem	193
3.3	The eigen-value problem	197
§ 4.	Theory of stability	204
4.1	The problem of stability	204
4.2	Definition of stability	204
4.3	General theory of stability	207
4.4	Stability with respect to first approximation	210
§ 5.	Asymptotic methods	212
5.1	Systems with small parameters in higher derivatives	212
5.2	The averaging method-Application to the theory of non-linear oscillations	222
	Bibliography.	227
V.	Partial differential equations. By F. JOHN	229
§ 1.	The first order equation	229
1.1	Solution by the method of characteristics	230
1.2	Complete solutions. Singular solutions	231
1.3	Relation to the calculus of variations.	233
§ 2.	Second order equations in two independent variables	238
2.1	One-dimensional unsteady flow	238
2.2	Two-dimensional steady flow	240
2.3	Linear and quasi-linear equations	242
2.4	Linear hyperbolic equations. Normal form. The initial value problem	244
2.5	The Laplace equation	247
2.6	More general elliptic equations	249
2.7	Parabolic equations	253
§ 3.	First order hyperbolic systems in two independent variables	257
§ 4.	General properties of partial differential equations.	259
4.1	Definition of characteristics.	259
4.2	Propagation of discontinuities.	263
4.3	Green's identity for linear differential equations	266
4.4	The Cauchy-Kowalewski theorem for analytic equa- tions	270

4.5	The notion of a well-posed problem	273
4.6	Classification of differential equations by type	277
§ 5.	Hyperbolic equations in higher dimensions	286
5.1	Equations with constant coefficients. Fourier transform method	286
5.2	Solution by decomposition into plane waves	289
5.3	Mixed problems	292
5.4	Energy inequalities	297
5.5	Existence proofs based on energy inequalities	301
§ 6.	Elliptic equations in higher dimensions.	302
6.1	Fundamental solutions.	302
6.2	Potential theory in three dimensions	306
6.3	Existence of solutions of the Dirichlet problem	313
VI.	Integral equations. By F. JOHN	316
§ 1.	Linear equations of the Fredholm type.	316
1.1	Linear integral operators	316
1.2	The Fredholm alternative	319
1.3	Applications to potential theory.	322
1.4	Volterra equations.	324
1.5	Fredholm integral equations with Hermitian or real symmetric kernels	326
1.6	Self-adjoint operators in Hilbert space	332
§ 2.	Singular integral equations in the complex plane	334
2.1	Cauchy integrals	334
2.2	The Hilbert problem.	335
2.3	The Riemann problem	336
2.4	Singular integral equations	338
§ 3.	Non-linear integral equations.	340
3.1	Examples	340
3.2	Solution of non-linear integral equations	342
	Bibliography for chapters V and VI	345
VII.	Approximation numérique de la solution des problèmes d'équations aux dérivées partielles. Par J. L. LIONS	348
§ 1.	Approximation de la solution des problèmes elliptiques	348
1.1	Principe de Dirichlet.	348
1.2	La méthode de Ritz-Galerkin	351
1.3	Différences finies	353
1.4	Généralisations. Autres problèmes elliptiques linéaires	358
1.5	Opérateurs de prolongement et restriction. Applications. Variantes	361
1.6	Problèmes unilatéraux	364

1.7	Problèmes non linéaires	365
1.8	Relations avec la théorie de l'approximation – Équations intégrales	366
1.9	Valeurs propres, fonctions propres.	367
1.10	Transformation des conditions aux limites	368
§ 2.	Équations d'évolution	371
2.1	L'équation de la chaleur. Position du problème	371
2.2	Semi-discrétisation	372
2.3	Discrétisation.	373
2.4	Équation des ondes	378
2.5	Problèmes non linéaires	381
§ 3.	Méthodes de décomposition et d'itération	382
3.1	Pas fractionnaires dans les problèmes paraboliques.	382
3.2	Problèmes d'évolution non paraboliques	386
3.3	Problèmes stationnaires	387
§ 4.	Méthodes de régularisation et stabilisation	389
4.1	Régularisation des opérateurs	389
4.2	Super-régularisation	390
4.3	Régularisation des conditions aux limites	393
4.4	Régularisation des domaines	393
4.5	Approximation par des systèmes du type Cauchy-Kowaleska	394
4.6	Stabilisation	395
	Bibliographie	397
VIII.	Optimisation. Par N. MOISSEEV et V. TIKHOMIROV	402
§ 1.	Programmation mathématique	402
1.1	Conditions nécessaires et conditions suffisantes d'extrémum	402
1.2	Méthode des multiplicateurs de Lagrange.	403
1.3	Recherche d'extremum à l'aide des conditions nécessaires	403
1.4	Méthode du gradient	404
1.5	Méthode du gradient projeté de Rosen	405
1.6	Programmation linéaire	406
1.7	Ensembles convexes	408
1.8	Fonctions convexes	410
1.9	Une condition fondamentale d'optimalité en programmation convexe	410
1.10	Théorème de Kuhn et Tucker ou du point de selle	412
§ 2.	Méthodes d'optimisation fondées sur l'analyse séquentielle des variantes	413

2.1	Problèmes additifs	413
2.2	Modification du problème du brachistochrone.	414
2.3	Schéma de calcul « balai de Kiev »	415
2.4	Réalisation numérique de l'algorithme	416
2.5	Un problème simple d'ordonnancement optimum	417
2.6	Procédure de la recherche du minimum de la fonction $M(u)$	418
2.7	Résolution locale-optimale	419
2.8	Amélioration du programme admissible	420
§ 3.	Calcul des variations	422
3.1	Sur le terme « calcul des variations »	422
3.2	Conditions nécessaires et suffisantes de minimum d'une fonctionnelle définie sur un espace vectoriel normé. Problèmes du calcul des variations	422
3.3	Exemples. Extrema fort et faible. Existence	428
3.4	L'équation d'Euler	431
3.5	Formule générale de la première variation de la fonctionnelle. Intégrale de l'équation d'Euler. Théorème de Noether	433
3.6	La deuxième variation. Etude de la fonctionnelle quadratique $K(h)$. Conditions de minimum faible	436
3.7	Équations canoniques. L'équation de Hamilton-Jacobi	441
3.8	Théorie du champ. Conditions suffisantes d'extremum fort	443
3.9	La condition nécessaire de Weierstrass	445
§ 4.	Problèmes du contrôle optimal	448
§ 5.	Résolution numérique des problèmes de contrôle optimal	452
5.1	Problème de Meyer et problème de Lagrange	452
5.2	Réduction à la résolution d'une équation algébrique	453
5.3	Problèmes linéaires	454
5.4	Méthode de transfert des conditions frontières.	455
5.5	Méthodes itératives utilisant le transfert des conditions frontières	456
5.6	Méthode de la factorisation non linéaire	457
5.7	Problème linéaire avec état final libre.	457
5.8	Le problème de Mayer non linéaire	458
5.9	La méthode de Krylov et de Tchernohusko	459
5.10	Méthode de pénalisation	459
5.11	Réduction de la dimension	460
5.12	Résolution approchée.	462
	Bibliographie	463

IX. Probability theory and its applications. By D. J. A. WELSH	465
§ 1. Basic concepts	465
§ 2. Stochastic processes	475
2.1 Processes with independent increments	476
2.2 Gaussian processes	476
2.3 Markov processes	478
2.4 Martingales	478
2.5 Stationary processes	479
§ 3. Some simple Markov processes	480
3.1 Two and higher dimensional random walks	485
3.2 The Poisson process	488
3.3 The simple branching process	491
§ 4. Homogeneous Markov chains	495
4.1 Asymptotic probabilities	501
§ 5. Renewal processes	505
§ 6. Continuous parameter Markov chains and age dependent branching processes	510
6.1 Age dependent branching processes	514
§ 7. Diffusion processes	516
7.1 Brownian motion	519
§ 8. Harmonic analysis of stationary processes	523
8.1 Spectral representation of stationary processes.	529
8.2 Linear operations on stationary processes.	532
§ 9. Estimation and prediction theory	536
9.1 Estimation for stationary processes	538
§ 10. Information theory	542
10.1 Entropy	544
10.2 Information sources	546
10.3 Encoding without noise	548
10.4 The channel	550
10.5 Decoding	551
§ 11. Conclusion	555
Bibliography	558
X. Quantum mechanics. By T. YAMANOUCHI	562
§ 1. Introduction	562
§ 2. Two-dimensional rotation group $R(2)$	563
§ 3. Group	564
§ 4. Infinitesimal transformation	565
§ 5. Invariants of a group	567
§ 6. Two-dimensional unitary group $U(2)$	569
§ 7. Representation of a group	571
§ 8. Schur's lemma	573

§ 9. Infinitesimal ring	575
§ 10. Representation of an infinitesimal ring	578
§ 11. Representation of $^*SU(2)$	580
§ 12. Relation between $SU(2)$ and $R(3)$	582
§ 13. Representation of $R(3)$	584
