PART I—THE METHOD OF WEIGHTED RESIDUALS

Chapter 1 Introduction

1.1 Basic Equations and Their Classification	4
1.2 Method of Weighted Residuals	7
References	12

Chapter 2 Boundary-Value Problems in Heat and Mass Transfer

2.1 One-Dimensional Heat Conduction	16
2.2 Reduction to Ordinary Differential Equations	20
2.3 Boundary Methods	24
2.4 General Treatment of Steady-State Heat Conduction	28

2.5	Mass Transfer from a Sphere	30
2.6	Choice of Trial Functions	34
	Exercises	36
	References	37

Chapter 3 Eigenvalue and Initial-Value Problems in Heat and Mass Transfer

3.1	Eigenvalue Problems	40
3.2	Transient Heat and Mass Transfer	44
3.3	Entry-Length and Initial-Value Problems	48
3.4	Mass Transfer to a Moving Fluid	58
3.5	Heat Transfer Involving a Phase Change	61
	Exercises	62
	References	65

Chapter 4 Applications to Fluid Mechanics

4.1	Laminar Flow in Ducts	68
4.2	Boundary Layer Flow past a Flat Plate	74
4.3	Laminar Boundary Layers	76
4.4	Natural Convection	83
4.5	Coupled Entry-Length Problems	85
4.6	Steady-State Flow Problems	88
	Exercises	91
	References	92

Chapter 5 Chemical Reaction Systems

5.1	Orthogonal Collocation	97
5.2	Unsteady Diffusion	107
5.3	Reaction and Diffusion in a Catalyst Particle	110
5.4	Tubular Reactor with Axial Dispersion	126
5.5	Packed Bed Reactor with Radial Dispersion	130
5.6	Relation to Other Techniques: Galerkin, Least Squares, Finite Difference, Finite Element Methods	135
	Exercises	144
	References	146

Chapter 6 Convective Instability Problems

6.1	Choice of Trial Functions	151
6.2	Application of the Galerkin Method	157
6.3	Time-Dependent Motion	176

6.4	Variational Methods	184
6.5	Nonlinear Convective Instability	194
6.6	Hydrodynamic Stability	196
	Exercises	202
	References	203

PART II—VARIATIONAL PRINCIPLES

Chapter 7 Introduction to Variational Principles

7.1	Calculus of Variations	212
7.2	Steady-State Heat Conduction	221
7.3	Laminar Flow through Ducts	225
7.4	Relation to Galerkin and Finite Element Methods	229
7.5	Variational Principles for Eigenvalue Problems	232
7.6	Enclosure Theorems	238
7.7	Least Squares Interpretation of D. H. Weinstein's Method	240
7.8	Lower Bounds for Eigenvalues	244
	Exercises	249
	References	250

Chapter 8 Variational Principles in Fluid Mechanics

8.1	Basic Equations	254
8.2	Variational Principles for Perfect Fluids	256
8.3	Magnetohydrodynamics	265
8.4	Non-Newtonian Fluids	270
8.5	Slow Flow past Drops and Particles	278
8.6	Variational Principles for Navier–Stokes Equations	285
8.7	Energy Methods for Stability of Fluid Motion	290
	Exercises	294
	References	294

Chapter 9 Variational Principles for Heat and Mass Transfer Problems

9.1	Fréchet Derivatives	299
9.2	Variational Principles for Non-Self-Adjoint Equations	307
9.3	Variational Principles for the Transport Equation	312
9.4	Applications to Heat Transfer	317
9.5	Applications to Mass Transfer	321
9.6	Upper Bound for Heat Transport by Turbulent Convection	328
	Exercises	332
	References	333

Chapter 10 On the Search for Variational Principles

10.1	Introduction	335
10.2	Entropy Production	337
10.3	Heat Transfer	339
10.4	Fluid Mechanics	347
	Exercises	349
	References	350

Chapter 11 Convergence and Error Bounds

11.1	Definitions	352
11.2	Boundary-Value Problems	357
11.3	Initial-Value Problems	370
11.4	Eigenvalue Problems	378
11.5	Error Bounds Using the Maximum Principle	381
11.6	Error Bounds Using the Mean-Square Residual	388
	References	393
