

Contents

Preface	vii
1 First ideas	1
BASICS	
Part 1 Deterministic Models	9
2 Deterministic models and their optimisation	11
3 A sketch of infinite-horizon behaviour; policy improvement	47
4 The classic formulation of the control problem; operators and filters	63
5 State-structured deterministic models	91
6 Stationary rules and direct optimisation for the LQ model	111
7 The Pontryagin maximum principle	131
Part 2 Stochastic Models	167
8 Stochastic dynamic programming	169
9 Stochastic dynamics in continuous time	179
10 Some stochastic examples	189
11 Policy improvement: stochastic versions and examples	215
12 The LQG model with imperfect observation	229
13 Stationary processes; spectral theory	255
14 Optimal allocation; the multi-armed bandit	269
15 Imperfect state observation	285
BEYOND	
Part 3 Risk-sensitive and H_∞ Criteria	293
16 Risk-sensitivity: the LEQG model	295
17 The H_∞ formulation	321

Part 4 Time-integral Methods and Optimal Stationary Policies	331
18 The time-integral formalism	335
19 Optimal stationary LQG policies: perfect observation	349
20 Optimal Stationary LQG policies: imperfect observation	357
21 The risk-sensitive (LEQG) version	371
 Part 5 Near-determinism and Large Deviation Theory	 379
22 The essentials of large deviation theory	383
23 Control optimisation in the large deviation limit	405
24 Controlled first passage	415
25 Imperfect observation; non-linear filtering	431
 Appendices	 443
A1 Notation and conventions	443
A2 The structural basis of temporal optimisation	449
A3 Moment generating functions; basic properties	455
 References	 457
 Index	 461
