

Table of Contents

Description and purpose of the work.....	ix
Preface	xi
 Chapter I Hierarchical Systems and Their Management	
	1
1.1. Hierarchical optimization of a catalytic cracking plant	1
1.2. Hierarchical optimization of a hydro and thermal power plant system	6
1.3. Hierarchical optimization and management of an interconnected dynamical system	14
1.4. Mathematical models in hierarchical multilevel system theory	19
1.4.1. Static multilevel models	19
1.4.1.1. Goal coordination	19
1.4.1.2. Predictive coordination	21
1.4.2. Multilevel optimization in nonlinear mathematical programming problems	23
1.4.2.1. Goal coordination	25
1.4.2.2. Predictive coordination	26
1.4.3. Decomposition and coordination for optimal control of discrete dynamical systems	27
1.4.4. Steady state system optimization and parameter identification	30
1.4.5. Nonlinear optimization problems with linear overlapping constraints	34
1.4.6. Hierarchical optimization and management of linear dynamical systems with quadratic cost function	36
1.4.6.1. Goal coordination	38
1.4.6.2. Predictive coordination	40
1.4.7. Reduction of functional optimization to parametric optimization	42
1.4.8. Hierarchical control with partial feedback	45
1.4.9. Hierarchical management in dynamical optimization systems by quasi - linearization	47
1.5. Two level mathematical programming models	51
1.6. Hierarchical model applications	53
1.7. Mathematical modeling in hierarchical system theory – summary	56
 Chapter II One step Coordination as a Tool for Real Time System Management	
	58
2.1. Relations between multilevel and multilayer hierarchies	58
2.2. One step coordination “suggestion-correction” protocols - a new noniterative multilevel strategy	59
2.3. General mathematical modeling for noniterative coordination	60

Chapter III	Noniterative Coordination with Linear Quadratic Approximations	63
3.1.	Analytical solution of the primal Lagrange problem	63
3.2.	Evaluation of the matrix $dx/d\lambda$	64
3.3.	Evaluation of the optimal coordination λ^{opt}	66
3.4.	Assessment of the approximations of $x(\lambda)$, $H(\lambda)$	70
3.4.1.	Approximation of $x(\lambda)$	70
3.4.2.	Approximation of $H(\lambda)$	74
3.5.	Approximation of the global optimization problem	77
3.5.1.	Approximation of $g(x)$	77
3.5.2.	Approximation of $H(x)$	78
3.6.	Analytical solution of the general problem of quadratic programming	79
3.7.	Noniterative coordination for block diagonal optimization problems	86
3.7.1.	Evaluation of the matrices $dx/d\lambda^T$, $dx/d\psi^T$	88
3.7.2.	Evaluation of the optimal coordinations λ^{opt} , ψ^{opt}	90
3.8.	Analytical solution of the quadratic programming problem in the block diagonal case	95
3.9.	Examples of block-diagonal problems	99
3.10.	Global optimization problem with inequality constraints	107
3.11.	Application of noniterative coordination to the general problem of quadratic programming	112
3.11.1.	Evaluation of the "suggestion" $x(0, \psi^*)$	113
3.11.2.	Application of noniterative coordination for sub-problem solution	115
3.11.3.	Analytical description of $x(\lambda, \psi)$	119
3.12.	Application of noniterative coordination for the optimal management of traffic lights of neighbor junctions	126
3.12.1.	Traffic flow modeling for two neighbor junctions	127
3.12.2.	Global optimization problem statement	129
3.12.3.	Solution of the global optimization problem and hierarchical system management	131
3.12.3.1.	Solution of local optimization sub-problems	132
3.12.3.2.	Evaluation of the matrix derivatives $d(\)/d\lambda$	133
3.12.4.	Solution of the dual Lagrange problem	136
3.12.5.	System management algorithm	138
3.12.6.	Simulations and results	139
3.13.	Application of noniterative coordination for optimal wireless data communication	145
3.13.1.	System description	147
3.13.2.	Modeling of the data communication process	149
3.13.3.	Optimal system management	153
3.13.4.	Optimal communication transfer	160
3.13.5.	Experiments and results in wireless communication	161

3.13.5.1. System error with an arbitrary sign	161
3.13.5.2. System error with positive sign	165
3.14. Conclusions	172

Chapter IV Noniterative Coordination applying Rational Pade Functions

4.1. Pade approximation of $x(\lambda)$	175
4.2. Modified optimization problem	180
4.3. Dual Lagrange problem	186
4.3.1. Derivation of $H(\lambda, \psi)$ without approximation	187
4.3.2. A numerical algorithm for solving the dual Lagrange problem	193
4.4. Dual Lagrange problem with approximation	202
4.4.1. Approximation of $H(\lambda)$ with Pade function R_{21}	202
4.4.2. Sufficient conditions for a single approximation $H(\lambda) \approx R_{21}(\lambda)$	203
4.4.3. Example of a single equality $H(\lambda) = R_{21}(\lambda)$	211
4.4.4. Properties of the dual Lagrange problem when $H(\lambda) = R_{21}(\lambda)$	218
4.5. Application of noniterative coordination for optimal hierarchical control of interconnected systems	223
4.5.1. Subsystem activities	226
4.5.2. Coordination rules	232
4.6. Application of noniterative coordination for fast solution of nonlinear optimization problems	236
4.6.1. Survey of methods for solving nonlinear programming problems	236
4.6.2. Linear- quadratic model of noniterative coordination in ill - conditioned problem	238
4.6.3. Quadratic - quadratic model of noniterative coordination in ill - conditioned problem	239
4.6.4. Experimental results	241
4.7. Comparison between the SQP, QQ and LQ algorithms on optimization problem for vector λ	243
4.7.1. Linear quadratic noniterative coordination	245
4.7.2. Quadratic - quadratic noniterative coordination	246
4.7.3. Comparison of results	248
4.7. Conclusions	249
Epilogue	250
Appendices	251
References	259
Index	266
