Preface xi

Introduction xiii

Chapter 1. Lipschitz and Smooth Perturbed Minimization Principles 1

1.1 Ekeland's variational principle 1
1.2 Constrained minimization and global critical points 5
1.3 A non-homogeneous elliptic equation involving the critical Sobolev exponent 8
1.4 Weak sub-solutions and super-solutions 12
1.5 A minimization principle with quadratic perturbations 14
1.6 The Hartree-Fock equations for Coulomb systems 17
1.7 A general perturbed minimization principle 21
1.8 Perturbed minimization and differentiability 26
1.9 Infinite dimensional Hamilton-Jacobi equations 29
Notes and Comments 33

Chapter 2. Linear and Plurisubharmonic Perturbed Minimization Principles 34

2.1 A minimization principle with linear perturbations 34
2.2 Weak*-H_δ subsets of dual Banach spaces 35
2.3 Generic results for non-homogeneous elliptic equations 39
2.4 Analytic martingales and optimization in L^p $(0 < p \leq 1)$ 41
2.5 A variational characterization of the plurisubharmonic envelope of a function 43

2.6 A plurisubharmonically perturbed minimization principle 45
Notes and Comments 50

Chapter 3. The Classical Min-Max Theorem 52

3.1 Homotopy-stable families 52
3.2 The basic deformation lemma for C^1-manifolds 55
3.3 The standard (PS) condition and a subcritical elliptic boundary value problem 58
3.4 The (PS) condition along a min-maxing sequence of sets and a resonant boundary value problem 61
Notes and Comments 66

Chapter 4. A Strong Form of the Min-Max Principle 67

4.1 Duality and the location of critical points 67
4.2 The (PS) condition around a dual set and a relaxed boundary condition 72
4.3 The forced pendulum 74
4.4 The structure of the critical set and the existence of good paths 76
4.5 Multiplicity results of Ljusternik-Schnirelmann type 77
4.6 Functionals with a common critical level and multiplicity of non-radial solutions on the annulus 80
Notes and Comments 89

Chapter 5. Relaxed Boundary Conditions in the Presence of a Dual Set 90

5.1 Another relaxation of the boundary condition 90
5.2 The *relaxed* mountain pass and saddle point theorems 95
5.3 The forced double pendulum 97
5.4 A *relaxed* boundary condition in the presence of linking 104
5.5 Second order systems 106
5.6 Critical points in the presence of splitting 108
5.7 Multiple solutions for a boundary value problem 110
5.8 Multiple solutions for a nonlinear eigenvalue problem 111
Notes and Comments 113

Chapter 6. The Critical Set in the Mountain Pass Theorem 114

6.1 Saddle points of mountain pass type 115
6.2 A theorem of G. Fang 120

6.3 A bifurcation problem 126
Notes and Comments 127

Chapter 7. Group Actions and Multiplicity of Critical Points 128

7.1 The equivariant min-max principles 128
7.2 Indices associated to a group and multiplicity results 131
7.3 The $\mathbf{Z}_2$-index of Krasnoselski 140
7.4 A *relaxed* $\mathbf{Z}_2$-symmetric mountain pass theorem 141
7.5 Multiple solutions in the presence of symmetry 143
7.6 The mod-2 genus 145
Notes and Comments 146

Chapter 8. The Palais-Smale Condition Around a Dual Set – Examples 147

8.1 A positive solution for an elliptic boundary value problem involving the critical Sobolev exponent 147
8.2 A sign-changing solution for an elliptic boundary value problem involving the critical Sobolev exponent 151
8.3 A second solution for a nonhomogeneous elliptic equation involving the critical Sobolev exponent 158
Notes and Comments 165

Chapter 9. Morse Indices of Min-Max Critical Points – The Non Degenerate Case 166

9.1 Homotopic, cohomotopic and homological families 166
9.2 The Morse Lemma 169
9.3 The transformation of Lazer-Solimini 170
9.4 Morse indices in the saddle point theorem 176
9.5 An asymptotically linear non-resonant boundary value problem 176
9.6 An asymptotically linear resonant problem of Landesman-Laser type 178
9.7 An asymptotically linear strongly resonant boundary value problem 181
Notes and Comments 182

Chapter 10. Morse Indices of Min-Max Critical Points – The Degenerate Case 183

10.1 Multiplicity results for critical points with a given Morse index 183

10.2 Restrictions of a homotopy-stable class to a neighborhood 187
10.3 The Marino–Prodi perturbation method 189
10.4 The reduction to the non-degenerate case 193
10.5 Application to some classical variational settings 199
Notes and Comments 203

Chapter 11. Morse-type Information on Palais-Smale Sequences 204

11.1 Palais-Smale sequences with second order conditions– the homotopic case 205
11.2 Multiple solutions for the Hartree-Fock equations 215
11.3 Palais-Smale sequences with second order conditions– the cohomotopic case 219
Notes and Comments 223

Appendices by David Robinson

A Relevant function spaces and inequalities 224
B Variational formulations of some boundary value problems 233
C The blowing-up of singularities 236
D Elements of degree theory 238
E Basic properties of martingales 243
