PREFACE

vii

Chapter 1

Heuristic Remarks and Mathematical Problems Regarding the Theory of Connecting Systems

1. Introduction	1
2. Summary of Chapter 1	3
3. Historical Sketch	3
4. Critique	5
5. General Properties of Connecting Systems	6
6. Performance of Switching Systems	13
7. Desiderata	15
8. Mathematical Models	17
9. Fundamental Difficulties and Questions	18
10. The Merits of Microscopic States	19
11. From Details to Structure	20
12. The Relevance of Combinatorial and Structural Properties: Examples	24
13. Combinatorial, Probabilistic, and Variational Problems	28
14. A Packing Problem	29
15. A Problem of Traffic Circulation in a Telephone Exchange	35
16. An Optimal Routing Problem	38
References	51

Chapter 2

Algebraic and Topological Properties of Connecting Networks

1. Introduction	54
2. Summary of Chapter 2	55
3. The Structure and Condition of a Connecting Network	56
4. Graphical Depiction of Network Structure and Condition	57
5. Network States	58
6. The State Diagram	62
7. Some Numerical Functions	64
8. Assignments	68
9. Three Topologies	69
10. Some Definitions and Problems	71
11. Rearrangeable Networks	75
12. Networks Nonblocking in the Wide Sense	77
13. Networks Nonblocking in the Strict Sense	79
14. Glossary for Chapter 2	80
References	80

Chapter 3

Rearrangeable Networks

1. Introduction	82
2. Summary of Chapter 3	84
3. The Slepian-Duguid Theorem	86
4. The Number of Calls That Must Be Moved: Paull's Theorem	88
5. Some Formal Preliminaries	89
6. The Number of Calls That Must Be Moved: New Results	90
7. Summary of Sections 8-15	96
8. Stages and Link Patterns	98
9. Group Theory Formulation	100
10. The Generation of Complexes by Stages	102
11. An Example	103
12. Some Definitions	105
13. Preliminary Results	106
14. Generating the Permutation Group	109
15. Construction of a Class of Rearrangeable Networks	113
16. Summary of Sections 17-21	119
17. The Combinatorial Power of a Network	121
18. Preliminaries	125
19. Construction of the Basic Partial Ordering	127
20. Cost Is Nearly Isotone on $T(C_n)$	128
21. Principal Results of Optimization	130
References	135

Chapter 4

Strictly Nonblocking Networks

1. Introduction	136
2. Square Array	137
3. Three-Stage Strictly Nonblocking Connecting Network	137
4. Principle Involved	139
5. Five-Stage Network	140
6. Seven-Stage Network	141
7. General Multistage Switching Network	142
8. Most Favorable Size of Input and Output Switches in the Three-Stage Network	144
9. Most Favorable Switch Sizes in the Five-Stage Network	146
10. Search for the Smallest N for a Given n for the Three-Stage Network	147
11. Cases in the Three-Stage Network Where $N \equiv r(\text{mod } n)$	147
12. Search for the Minimum Number of Crosspoints between $N = 23$ and $N = 160$	150
13. Search for the Minimum Number of Crosspoints for $N = 240$	150
14. Rectangular Array	152

15. N Inputs and M Outputs in the Three-Stage Array	152
16. Triangular Network	153
17. One-Way Incoming, One-Way Outgoing, and Two-Way Trunks	155
18. Comparison with Existing Networks	155
19. Conclusion	157
Reference	158

Chapter 5

A Sufficient Set of Statistics for a Simple Telephone Exchange Model

1. Theoretical Problems and Methods of Traffic Measurement	159
2. Description of the Mathematical Model	165
3. Discussion of the Model	167
4. Summary of Notations for Chapter 5	168
5. The Average Traffic	169
6. Maximum Conditional Likelihood Estimators	170
7. Practical Estimators Suggested by Maximizing the Likelihood L , Defined in Section 11	171
8. Other Estimators	172
9. The Joint Distribution of the Sufficient Statistics	173
10. The Distributions of Z and M	177
11. Proof that (n, A, H, Z) Is Sufficient	183
12. Unconditional Maximum Likelihood Estimators	184
13. The Joint Distribution of x_T, n, A, H , and Z	185
References	186

Chapter 6

The Covariance Function of a Simple Trunk Group, with Applications to Traffic Measurement

1. Introduction	188
2. Discussion, Summary, and Conclusions	190
3. The Covariance Function	202
4. The Covariance in Terms of the Recovery Function	208
5. The Variance of the Number of Paths in Service	209
6. The Variance of Time Averages	212
7. Derivation of the Covariance	215
8. Approximation to the Dominant Characteristic Value	219
References	221

Chapter 7

A "Thermodynamic" Theory of Traffic

1. Introduction	223
2. Preliminaries	224
3. Summary of Chapter 7 and Discussion	225
4. Equilibrium	230
5. The Maximum Entropy Principle	232
6. The Canonical Distribution	234
7. Properties of the Partition Function	237
8. A Reversible Markov Process for Which the Canonical Distribution Is Invariant	241
9. Analogy with Statistical Mechanics	244
10. Discussion and Critique	246
11. A Markov Model Based on Terminal-Pair Behavior	250
12. The Approach to Equilibrium	252
13. Covariance of Functions of x_t	257
14. Applications to Sampling Error	261
15. A Generalization	262
References	264

Chapter 8

Markov Processes Representing Traffic in Connecting Networks

1. Introduction	266
2. Preliminary Remarks and Definitions	267
3. Summary of Chapter 8	269
4. Probability	271
5. Operation	272
6. Transition Rates	273
7. Markov Processes	274
8. Probability of Blocking	276
9. A Basic Formula	281
10. Solution of the Equations of Statistical Equilibrium	285
11. Stationary Probability Measures for Ergodic Markov Processes	290
12. Expansion of the Stationary Vector p in Powers of λ	295
13. Expansion of the Probability of Blocking in Powers of λ	300
14. Combinatorial Interpretation and Calculation of the Constants $\{c_m(x, 0), x \in S, m \geq 0\}$	303
15. Calculation of $c_m(x, \lambda)$	309
References	313
