Contents

Preface v

Chapter 1: Introduction 1

Chapter 2: The Analysis of Choice Experiments 9

2.1 Random variables 10
2.2 Thurstone's Law of Comparative Judgment . . . 13
2.3 An example of Thurstonian scaling 15
2.4 Conditional probability and the Constant-Ratio Rule . . 19
2.5 Luce's Choice Axiom 21
2.6 Experimental tests of the Choice Axiom 24
2.7 Comparisons of the Luce and Thurstone choice models . 26
2.8 Choices from three or more alternatives 27
2.9 Rank orderings 29

Chapter 3: Subjective Sensation 35

3.1 Fechner's Law 36
3.2 Steven's power law 37
3.3 Ekman's Law. 42
3.4 The relation between the Weber and power laws in terms of Luce's choice theory 46
3.5 On the use of the label "sensation" 47
3.6 Constant errors and related effects 48

Chapter 4: Theories of the Psychophysical Threshold . . . 53

4.1 The classical concept of a psychophysical threshold . . 54
4.2 The neural quantum theory 56
4.3 Criticisms of the neural quantum theory 60
4.4 The statistical representation of sensory discrimination . 68

Chapter 5: Signal Detection 73

5.1 The signal-detection model of Tanner and Swets . . 76
5.2 Experimental manipulation of the operating probabilities . 78

5.3 The form of the empirical operating characteristic . . 86
5.4 The choice of operating point 92
5.5 The import of the experimental results 97

Chapter 6: Further Models for Signal Detection 105
6.1 Blackwell's high-threshold model 107
6.2 Luce's threshold model 110
6.3 Krantz's 3-LHT model 113
6.4 Atkinson's variable sensitivity model 115
6.5 Norman's multi-state quantal model 117
6.6 Luce's choice model 120
6.7 The exponential model 123
6.8 Comparative experiments 125

Chapter 7: The Ideal Observer 132
7.1 Absolute visual thresholds 133
7.2 The notion of an ideal observer 136
7.3 The ideal observer model for the signal known exactly . 138
7.4 The ideal observer model for the signal one of *n* orthogonal signals 141
7.5 The ideal observer model for the signal known exactly except for phase 142
7.6 The ideal observer model for the signal a sample of noise . 145
7.7 Weber's Law 148

Chapter 8: Simple Reaction Time 151
8.1 Addition of independent random variables . . . 152
8.2 The neural series hypothesis 154
8.3 Criticisms of the neural series hypothesis 157
8.4 General gamma distributions 158

Chapter 9: Choice-Reaction Time in Relation to Uncertainty . . 161
9.1 Stimulus uncertainty 164
9.2 Justifications for the measure of uncertainty . . . 166
9.3 Ideal communication systems 167
9.4 Applications of the Communication Model . . . 169
9.5 Luce's choice model for reaction time 173
9.6 A test of the Choice Axiom 176

Chapter 10: Sequential Sampling Models for Choice-Reaction Time . 178
10.1 Bayes' Theorem 182
10.2 Information 183
10.3 Random walks 184

10.4 Application of the sequential probability-ratio test to choice-reaction experiments 186
10.5 Some comparisons of the sequential sampling model with experimental results 190
10.6 A derivation of the logarithmic relation between mean choice-reaction time and the number of equiprobable alternatives 193
10.7 The fast-guess model 194

Chapter 11: Sequential Interactions in Choice-Reaction Experiments . 197
11.1 The repetition effect 199
11.2 The notion of "preparation" 200
11.3 The relation of the sequential pattern to expectancy . . 203
11.4 Markov chains 207
11.5 A Markov model for sequential interactions . . . 209
11.6 Linear models 210
11.7 A linear model for subjective probability 213
11.8 A comparison of the three theories of sequential interactions 218

Chapter 12: Stimulus Sampling Theory 220
12.1 The essentials of stimulus sampling theory. 221
12.2 Applications of stimulus sampling theory 223
12.3 Subsequent development of stimulus sampling theory . . 229
12.4 Linear models for learning 231
12.5 Luce's beta model 233
12.6 Pattern models 234

Chapter 13: All-or-None Learning 236
13.1 Estes' miniature experiments 237
13.2 The one-element pattern model 240
13.3 Psychological interpretations of all-or-none learning . . 246

Chapter 14: Markov Models for Learning 253
14.1 Empirical difficulties with the one-element model . . 253
14.2 Models with asymptotic response probability less than one . 256
14.3 Models with perfect learning 260
14.4 Conditional error probability 264
14.5 The trial-dependent forgetting model 266
14.6 Evidence for an imperfect learning state 269

Chapter 15: Discrimination Learning 271
15.1 Concept identification experiments 271
15.2 A model for concept identification experiments . . . 274
15.3 An illustrative experiment 277
15.4 Levine's experiment 282

15.5 Hierarchical levels of learning 286
15.6 Implications for mathematical learning theory . . . 290

Chapter 16: Avoidance Learning 293
16.1 The two-element pattern model for one-way avoidance learning 295
16.2 The two-operator linear model 299
16.3 The two-operator beta model 302
16.4 The multi-element pattern model 304
16.5 A comparison of the several models for avoidance learning . 305
16.6 Psychological identification of the two stages of avoidance learning 307
16.7 An alternative interpretation of avoidance learning . . 310
16.8 Brelsford's experiments 310
16.9 Comparisons with traditional avoidance theories . . 315

Chapter 17: Probability Learning 317
17.1 The multi-element pattern model 318
17.2 Analysis of a probability learning experiment . . . 320
17.3 The linear model 322
17.4 Patterns of responding in asymptotic performance . . 324
17.5 A comparison with probability learning in choice-reaction experiments 325

Chapter 18: Three Mathematical Motifs: their Usefulness and their Psychological Significance 329
18.1 Choice behaviour 329
18.2 Signal detection and psychophysical thresholds . . . 334
18.3 Choice-reaction time 339
18.4 Asymptotic performance 341
18.5 Learning 342
18.6 Conclusions 347
